CENSUS OF INDIA, 1911.

MADRAS.

IMPERIAL SERIES, VOLUME XV. PROVINCIAL SERIES, PART I.

THE REPORT ON THE CENSUS.

INTRODUCTION.

THE fifth decennial census of the Presidency was taken on the night of March 10th, 1911, and details of the process are set forth at length in the Administrative report, Volume XII, Part III, of the present series. But that volume is intended peculiarly for the use of future Superintendents, and is not likely to come within the ken of the general reader. Assuming that these presents do find a general reader, such person may wish for some brief account of how the thing was done; if only to rid his mind of a lingering doubt as to whether the Census Superintendent is not indebted to his imagination for many of the facts which he sets forth.

2. The vast majority of the population enumerated live in villages; and the village of Southern India bears little resemblance to the mental picture suggested by the word in its European sense. Instead of orderly rows of fairly substantial houses fronting some well-used thoroughfare, the incipient statistician finds a bewildering medley of cottages, leaf-huts, cowsheds, and straw-yards, arranged on no apparent plan, and often lying hidden in a grove, or isolated in a swamp, miles distant from any public highway. At the first glance it would seem well nigh impossible to account even for the villages of the Presidency, without seeking further to ascertain the number of houses in each such village, and that of the inhabitants in each house.

3. The problem however becomes simplified by a consideration of already existing administrative divisions. The Presidency is divided into districts, each district into divisions, each division into taluks, each taluk into firkas. If a firka contains on an average some 25 to 30 villages, the formidable total resolves already into defined units of not unmanageable size.

4. Furthermore if he essays himself to draw up the house-list of a village, the bewildered Superintendent gathers comfort from a gradually observed fact. If to him the ordinary village is merely a planless maze of blind alleys and crooked lanes, to the Karnam, who has lived there all or most of his life, this tangled skein presents no particular difficulty. Whether he actually perambulates the village, or casts up an account in the reflective ease of his verandah, it does not take him very long to set down the tale of houses, and chief occupant of each. The number of houses known, it is sufficiently easy to map them out in compact blocks of 25 to 30, to each of which an enumerator is assigned: blocks are grouped into circles under a supervisor, and circles into charges under a superintendent. When these charges are subsumed under the administrative taluks, each district has already taken census shape.

5. While this work pushes in the districts, the form of schedule leaf, on which enumeration particulars will be entered, has been settled, and the necessary translations into the vernaculars of the Presidency prepared. From the records of previous censuses it is possible to estimate with tolerable exactitude, and have printed, the number of forms that will be required; on receipt of the village house-lists with proposed division into blocks, supplementary orders for printing can be given, and leaves bound into books of standard size. A twelve-leaved book will as a rule suffice for the enumeration of 25 houses.

6. But before these books can be despatched to Tahsildars for distribution to the Charge Superintendents of their taluks, and thence to the enumerators, an important step remains to be taken.

7. It is of little use to provide an enumerator with a book, and tell him to enumerate some 25 houses of a village; he must be enabled to identify the particular houses with which he has to deal. Accordingly, on each house door is painted the serial number assigned to each house by the Karnam in his initial count. This actual numbering affords at once a check on the accuracy of the original house-list, while in an index provided for the enumerator's book are posted the numbers appearing on the houses that fall to his lot, with the names of the householders.

8. Armed with this information the enumerator, some six weeks before the census night, commences the round of his block, and gradually fills up details for the persons living therein. On the actual night he visits each house, and checks the correctness of the entries already made. Next morning the enumerators meet their circle supervisors at some place previously appointed: the entries in each book are totalled by sexes, and these totals, with the books, are sent to the Tahsildar of the taluk. From such material that sore toiled man makes out the total population of his taluk, and sends the figures to the Collector. The Collector combines these returns into the total of his district, and telegraphs the figures to the Census Commissioner for India, and to the Superintendent of the Province. These figures are published as the *Provisional Totals*. The provisional totals appeared in print seven days after the census. Allowing for travellers by sea, enumerated after the actual census night, they varied but by 3,600, or '0086 per cent., from the totals as finally ascertained.

9. Meanwhile each Tahsildar has packed up the books which he has received, and forwarded them to the Central Abstraction office. Here they are issued in regular order to a staff of copyists, who copy the particulars noted against each person on to a slip. These slips are sorted into various combinations, and the Imperial and Provincial tables represent the figures ascertained by these sortings.

10. In addition to the good citizens whom the enumerator worries in their households, there are on any given night a certain number of persons travelling in trains: others are following their occasions on foot or in the humble bullock cart; while some thousands will be found assembled together listening to the soulful tom-tom at festal gatherings.

11. To the presumably literate first or second class railway passenger a form is provided by the guard of the train: this he is requested to fill up and deliver to the station-master when he alights. For the third-class multitude a more elaborate procedure is necessary.

12. Fortunately the simple Indian is disposed to regard the arrival or departure of a train rather as an arbitrary dispensation of Providence than as an occurrence preordained by a Traffic Superintendent. It follows that the traveller is apt to arrive in good time at his station of departure. At every station in the Presidency enumerators were appointed, who enumerated as many as possible of those who announced their intention of travelling by a train timed to start at or after 7 P.M. To each such person was given a ticket, on which was printed in seven languages the word "*enumerated*." Every person descending unpossessed of such ticket throughout the night was enumerated at the station of arrival; while at 6 A.M. (or as near as might be) on March 11th every running train was stopped, and those yet unaccounted for were gathered in.

13. For travellers by road police and toll gate-keepers account, or are supposed to do so. Festival centres are ascertained beforehand, and a special staff of enumerators detailed thereto.

14. The tale of the census is not yet finished. In certain jungle tracts, such as the hills of Vizagapatam and Ganjám, nocturnal wanderings, if not impossible, are at least unadvisable; in the Javádi hills of North Arcot, and the Attapádi valley of Malabar, native talent does not suffice, and literate enumerators "go bitterly," (*vide* district reports), from the plains. From the Laccadive and Amindivi Islands the schedules must get sailed to the main land. In all such tracts the census had perforce to be taken by day, and at times fixed with reference to the seasonal unhealthiness of such places, and the period required for getting in the returns.

15. Suppose the census safely taken, the provisional totals added up, the schedule books committed to the mercy of the railway companies, and the country at peace. Subsequent proceedings alluded to in paragraph 9 perhaps deserve a somewhat fuller treatment.

16. There are some 70 languages current in Madras, but of these six alone, (Tamil, Telugu, Malayálam, Canarese, Oriyá and English), are offered to the choice of the schedule writer. Offices for dealing with Tamil and English matter suggest themselves in Madras, Malayálam work obviously must be done in Malabar, Oriyá in Ganjám. South Canara is now the obvious centre for Canarese, although in 1901, owing to lack of railway communication with South Canara, the work was got done at Calicut by clerks toilsomely persuaded thither. Telugu remains, and it would at first seem a fairly obvious plan to send such schedules to the Telugu country. But these Telugu returns require a staff far larger than that needed in any language save Tamil, and accommodation for some 800 men is not easily found outside Madras.

17. Accordingly six offices, three for Tamil, and three for Telugu, were opened in Madras.

18. In 1901, these offices were perforce scattered through the city in various buildings, for which a considerable rent had to be paid. In 1911, fortune and the courtesy of the Army Department provided free the disused Gun Carriage Factory, a vast building with accommodation for thousands of workers. Here then were the offices opened; beginning with an experimental strength of 50, by 8th April they contained 500.

19. The Gun Carriage Factory was but space unadorned; some matter of furniture was needed ere work could move in right earnest. For the habit of modern schools has lost an art to the Madrasi; the youthful scholar no longer drives the quill with any tolerable comfort or speed, while squatting cross-legged on the floor. Such chairs and tables may be bought; but who would buy if he could borrow, and in former years most accommodating lenders were the University of Madras, and the Commissioner for Government Examinations. Now, the University Examinations were in full swing just when the census abstraction offices would open: the Commissioner's furniture was either in use at his own examinations, or boarded out with schools, who used it in return for giving it storage. Even with new chairs and tables bought for Rs. 1,300, the offices worked at nothing like their proper strength till May 1st, when 1,075 men were engaged. The few figures in the margin give some idea of what might have been but for this furniture difficulty.

	Number of abstractors employed.			
May 8th	...	...	...	1,195
May 16th	...	...	...	1,394
May 23rd	...	...	...	1,443

20. And yet it is only fair to doubt whether, with all facilities for furniture, many more men than a thousand could have found work before the end of April. With the exception of the schedule books for Madras city, it was not till about March 20th that packages from the districts began to arrive; but then they came in van loads. Statistical use and honoured custom seem to demand a calculation of how many times these schedule books piled atop of each other would reach to heaven, carpet the path from John of Groat's to Lands End if strewn lengthways, encircle the earth tacked page to page. It is perhaps sufficient to state that an average

schedule book contains fifteen pages of very thin paper 20 inches long by $8\frac{1}{3}$ in breadth; and that there were some 30—40 tons of such books. They filled to overflowing the basement of the hospital building in the factory—two great halls measuring $90' \times 18'$ each—and overflowed into the verandahs. Before the books could be given out for posting, they had to be arranged by circles, charges, taluks, and districts, and stored in orderly fashion upon racks. The task was far beyond the powers of a record-keeper with two assistants, but the accident, that kept two Deputy Superintendents and some 25 to 30 Supervisors unemployed at their proper work for about twenty days, rendered their services available for this task.

21. Slip copying, sorting, and compilation, have been described generally in the reports of 1901, and in detail in the administrative reports of that year, and that of 1911. It is unnecessary to tread again the well-trodden ground.

22. Slip copying ended on 17th June 1911. From a maximum of 462 in seven hours on 3rd April, some posters after practice attained the almost incredible figure of 1,737 per day. Sorting rates varied for each table, but the appended maximum figures give some idea of the speed attained.

Week ending 1st July	...	6,600	Ordinary sorting.
Do. 15th July	...	8,800	do.
Do. 29th July	...	7,800	(Partly ordinary and partly occupation sorting).
Do. 5th August	...	5,500	Occupation sorting.
Do. 12th August	...	7,100	Do.

23. The time occupied with census work, and the exact cost of the undertaking it is not easy to state with absolute accuracy. With the preparation of the Imperial tables and report proper are associated certain provincial details, such as the compilation of village statistics for every district in the Presidency, revision of the statistical portions of the District Gazetteers, etc. Furthermore these remarks as regards time and money must necessarily be written before the census offices are finally closed, before the report and tables are published, and before the final accounts for printing are rendered.

24. The first Imperial Table (No. VII, part 1) was sent to Press on August 25th, 1911; the last (No. XV-A, part 2) on January 8th, 1912. At the end of April 1912 all Imperial tables had been printed, revised, reprinted, and submitted for approval to the Census Commissioner for India. The striking of tables finally approved by him had been commenced.

The report, with the exception of these present paragraphs, had been written, printed, revised; and stood in clean proof ready for striking.

The tables for the Province of Coorg had been printed and revised; the report for that Province written but not printed.

The "Administrative Report," which deals with the organization and accomplishment of the census, had been sent to Press.

"Village statistics" for all districts of the Presidency, and for the Pudukkóttai State, had been completed.

The revision of the statistical volumes of District Gazetteers had been put in hand.

25. The accounts of the census are maintained in a two-fold form: (a) departmental, (b) financial. Departmental accounts show everything actually paid out in connection with the work; the financial accounts admit certain abatements, such as salaries which in the ordinary course of things would have to be paid, irrespective of whether a census was toward or not.

From the beginning of April 1910 to the end of March 1911 departmental accounts showed an expenditure of two lakhs, sixty-two thousand rupees; which exceeded the total of the financial accounts by some thirty-six thousand rupees. Adding the estimated cost of printing, salaries disbursed in the opening months of the year 1912–1913, and deducting recoveries from municipalities, Native States, from sale of paper and furniture, etc., the total cost of the census may be estimated at two lakhs, sixty-three thousand rupees, on departmental account, or two lakhs, fourteen thousand rupees, on financial. The heaviest item of expenditure was

naturally the maintenance of the nine large abstraction offices, of which the departmental cost amounted approximately to one lakh, sixty thousand rupees.

26. To all who have helped me in this work I wish to express, however imperfectly, my acknowledgments. To all Collectors and other district officers, who carried through the troublesome task of the actual enumeration with admirable promptitude and care. To the superintendents of the abstraction offices Messrs. A. Narayana Aiyangar, T. Arokiaswami Pillai, A. K. Knppusawmi Aiyar, T. Ranganadhan Mudaliyar, C. Mohideen Khan, R. Derasawmi Aiyar, M. Venkata Rao, K. N. Cheyikutti and M. Thiadi; who directed their huge establishments with unfailing energy and care. To Mr. Fisher, Superintendent of the Government Press, Mr. Gilbert, Deputy Superintendent, and their subordinates, who carried out the enormous mass of work, which the census entails on them, with wonderful speed and accuracy; and who met every demand, (and there were many of them), for extra schedules, proofs, reprintings, etc., with unfailing courtesy. To Mr. C. S. Gopal Aiyar, who had charge of the records of the abstraction offices, Messrs. S. Shanmugam Pillai and V. Muttusawmi Aiyar, who kept the accounts and paid the workers, and to Mr. S. Ramasawmi Aiyangar, who prepared the subsidiary tables for each chapter of this report.

27. To those who have assisted me in the writing of the report I have endeavoured to render my thanks in the text itself: If, as is too probable, I have omitted any name, oversight, not ingratitude, I may plead as my excuse. To one in particular I owe an especial debt—my late personal assistant Mr. S. Dandapani Aiyar. His industry and accuracy as regards clerical detail have been described by my predecessor of 1901; in wider matters of arrangement and ideas I have come to look on him as a collaborateur rather than as a subordinate.

CHAPTER I.—DISTRIBUTION OF THE POPULATION.

(a) THE PRESIDENCY AND ITS PEOPLES.

MADRAS, the southernmost province of British India, is bounded on the west, south, and east, by the open sea. Its northern boundary, running from west to east, touches on the Presidency of Bombay, the Mysore State, the Dominions of His Highness the Nizam, the Central Provinces, and the newly constituted Province of Bihar and Orissa. The area of the Presidency, the feudatory states of Travancore and Cochin, and the Province of Coorg, being excluded for the purposes of the present census, is 143,924 square miles: its greatest length from north-east to south-west being approximately 950 miles, and its maximum width 450 miles.

2. Travancore and Cochin conduct their own census operations, and publish their own reports: the small states of Pudukkóttai, Banganapalle, and Sandúr, are, for the purpose of census, included in the charge of the Madras Provincial Superintendent.

3. The area of the Presidency has recently received a trifling addition by the transference from the Central Provinces of the Nugur taluk. But in the ten years that have elapsed since the last census, modifications in its internal administrative structure have been considerable. The 22 administrative districts of 1901 have resolved into 25.* Guntúr district has emerged from a shuffling of the boundaries of Kistna, Gódávári, and Nellore; the Madura of 1901 presents itself as Madura and Ramnad; while North Arcot, after a projected cessation of existence, finds re-incarnation in the forms of North Arcot and Chittoor. Twenty-three new taluks have come into being, while the boundaries of some 50 more have been affected by transfers of area.

4. Though administrative changes come and go, the natural features of a country remain unaltered. A detailed description of each district and state would but leave confusion worse confounded in the mind of a reader unacquainted with the Presidency, but each of the six natural divisions presents some sufficient element of distinction, either in physical circumstance, or in the characteristics of its people. On this latter peg may be hung some brief description of the *Agency division* and its primitive inhabitants.

5. Typical of such people is the Khond—Kui, he calls himself—a short, thick-set, good-humoured, jungle man. He lives in a cabin built of rough hewn planks, has a predilection for toddy, and an aversion to education; generally speaks the truth, worships singularly unpleasant devils in a strangely unpleasant manner, and in his worldly affairs exhibits a deplorable, but eminently cheerful, disregard for the morrow. Of admirable physical development, he likes to set off his beauty with a white flower stuck in his top-knot; but the most noticeable article of his attire is his *tangi*, an axe with brass bound handle, wherewith on reasonable occasion he batters earnestly the flinty head of his brother Khond. The gentler sex, in whose ears straws as yet unreplaced by brass rings denote, if not maiden meditation, at least an element of non-permanency in attachment, afford small material for speculation to a modern clothes-philosopher; a cloth tied round the waist, *et practerea nihil*, satisfies the simple taste that declines the immodesty of an upper cloth.

6. Here too are found the Savara, a matter of fact not very interesting person, the graceless vagrant Pano, the hill Oriya exercising a patriarchal form of Government as Patro of a muttah, and his trading brother from the plains.

* Or 26, if Anjengo be considered as a "district."

7. Descending eastwards and south through the plains, where the Oriya ploughs beneath his *matinée* hat, curiously devised from a shallow basket turned upside down and tied beneath his chin, we come to the country of the Telugas. Nine districts in the Presidency return Telugu as their official vernacular, but Gódvári, Kistna, and Guntúr, in the *East Coast Division (North)*, are pre-eminently the home of this people. Here, in the great deltas of the Kistna and Gódvári rivers, irrigation and rice growing become the dominant features of the country; in 1910-1911 Gódvári grew 664,173 acres of rice and other irrigated crop, Kistna 966,497 acres, and Guntúr 327,874 acres.

8. The prosperity conferred on the *East Coast Division (North)* by the Kistna and Gódvári irrigation system is apparent to the eye, and finds its proof in the statistics of density of population, and revenue accruing to the State. Yet for the human beings, with whom the census deals, this water-induced prosperity may be not altogether unattended with disadvantage. A rice field is a pleasant thing to contemplate, and profitable to possess; but its cultivation implies residence in a quagmire hardly conducive to physical, or indeed moral, excellence. Few people may die of starvation in the deltas, but many live a prey to rheumatism, malaria, spleen, litigation, and kindred ills; while it is questionable, and questioned by many of the more thoughtful dwellers in these districts, whether the easy certainty of a crop has not dulled the industry, and caused a forgetfulness of the old skill in husbandry, which the former struggle against adverse nature demanded.

9. This point is accentuated for the visitor to the *Deccan division*, where at first glance the great black plains, the aching wildernesses of stone, the bare dusty roads, and summer air half dust and wholly heat, realise vividly the abomination of desolation. Yet longer stay discovers a fascination in these dour lands, and closer acquaintance wakens a sentiment of admiration for the tall grave Reddi, struggling manfully in truncated breeches against the obstinacies of nature. Without the prop of irrigation he has learned a sage economy of effort; his "*pani pudhu*" denotes, not so much a disinclination to work, as a recognition that it is foolish to squander industry, of which the reward is not sure. "It is better," he says, "to die of starvation than of overwork;" he is born with a resolve not to die of a combination of the two. Educational and other statistics show the Deccan ryot backward, but in truth the contrast of his fine physique, and shrewd mother wit, with the cultured anæmia of his statistically more advanced fellow countryman, is not altogether to his disadvantage.

10. The black plains of the Deccan are obvious to any one: it is not so easy to set down a general characteristic for the Tamil country, that constitutes the *fourth* and *fifth divisions*. "Colour and shade" may seem vague if not self contradictory: yet it may suggest a mental picture not altogether inaccurate. The treeless ugliness of the grey Deccan villages gives place to many coloured clusters of houses, some whitewashed, some bright with red tiled roofs, some thatched; all as a rule built near, or amid, overshadowing trees. Bleak dusty roads are exchanged for pleasantly overarched avenues, a curious tinge of red showing through the surface. Though irrigation abounds, the effect suggested is rather an added fertility to a country not unpromising, than the sodden wealth of the great deltas of the East Coast.

11. If we turn from the country to its inhabitants, the thought arises that, as the Deccan ryot has found salvation in his struggles with Nature, so the peculiar excellencies of the Tamil are in a sense reflected in the characteristics of his mother tongue—"ce langage criard, obscur, et mal articulé." Few would call Tamil beautiful; yet its great harsh words, that one can almost bite as they pass the teeth, the stubborn inelasticities of its construction, suggest a certain doggedness in the people, who have subdued such an untractable organ to their daily use. The Tamil ryot has not, as a rule, the natural advantages that have abated the need for intelligence in the Eastern deltas, nor have his wits been sharpened, like those of the Deccan countrymen, by necessity of not squandering effort that Nature may render fruitless. To win his bread he must work, but if he works he can have a tolerable sureness of success. Without undue deprecation of the Tamil's natural

endowments, we may find the explanation for his pre-eminence in standardised education, and affection for the careful business of the city, in a marked capacity for dogged work, or that capacity for taking pains once defined as genius.

12. Even the jaded railway traveller of modern days can scarcely fail to notice the remarkable scenic contrast, which the rounding of the corner of the Western Ghauts presents to his eyes. But more striking than any mere change in the physical configuration of the country, is the thought that here, in the *West Coast Division*, the Indian leads a life comprehensible, at least in appearance, to the stranger. To the European, elsewhere it seems inexplicable that the well-to-do farmer of the village, or prosperous, educated business man of the town, should not look for air, space, and such obvious agreements of life, as his position would seem to indicate, and his means procure. Yet the rich ryot of Tanjore or Kistna does not seem desirous of surroundings more amenable than the soggy lanes of his village afford; the shopkeeper of the towns finds a sufficient relaxation in the dusty noise of his unattractive street; in his grimy *parachéri*, the cooly, freed from the uninterest of his daily toil, bolts a pessimistic meal. Here, in the *West Coast Division*, the huddled squalor of the eastern villages gives place to the solid comfort and freedom of substantial homesteads scattered over the country side; the pleasant airy buildings of the western cities form a charming contrast to the stewing houses of the eastern towns. Here too, at the teashops which flourish on all sides, even the cooly finds time to refresh himself in a manner more suggestive of humanity than of the furtive gobbling of a cat or dog.

13. In this home of orthodoxy the strange strict caste system is far more intelligible to the heretic than its laxer presentation in the East. If the aristocratic Nambúdiri, living secluded in his country house, considers that certain of his fellow-countrymen do pollute him by their contiguity, he, to some extent at least, lives up to his own ideal of spotless cleanliness, and aloofness from the common herd, and does not expect recognition for a non-apparent sanctity obtruded in the forum; the Tiyan's good humoured recognition of the claims of long descent has not for him implied acquiescence in degradation.

14. There may be another side to this pleasant picture, and to disciples of the strenuous life, this graceful aristocratic people, contentedly watching their cocoanuts grow in their lotus land, may recall the great and jolly nation of the Doasyoulikes, who sat beneath the wild flapdoodle tree. The richness of the country is in a large measure due to the abundant rainfall, which in turn, combined with the heat, induces in the native a Turkish bath like indolence, not less surely, if less perceptibly, than in the foreigner. Yet the bustle of the Máppilla bazaars compares not unfavourably with the dustiest strenuousness of Tuticorin, while in education, and especially female education, Malabar enjoys an honoured eminence in the Presidency.

(b) DENSITY OF THE POPULATION.

15. From a general description of the Presidency and its inhabitants, one passes naturally to a consideration of the degree of density where with these latter burden the earth's surface. The argument of this chapter rests on a somewhat firmer basis than that of its successor, inasmuch as it deals with the undoubted existence of people rather than with the causes which modify that existence.

16. A population of 291 souls to the square mile now represents the average density of occupation of the Presidency. Figures quoted in the margin permit comparison in this respect with some few European and other countries. But, as would be expected from the heterogeneity of countries, climates, and peoples prevailing in Madras, the extremes from which this mean is deduced differ somewhat widely; ranging as they do from a sparse 80 per square mile in the Agency division, to a five-fold greater density (429 per square mile) in the south-east.

Density per Square Mile.

17. Whatever be the vicissitudes that may attend colonization and development of a new country, it may be assumed that in Southern India density of population has now to a great extent adjusted itself to local possibility of subsistence and to climatic conditions.

18. Although variations in the decennial rates of increase or decrease, which may be seen in subsidiary table I to Chapter II, suggest possibilities of an ultimate change in the relative positions of districts, or of natural divisions not utterly dissimilar, it is on the whole improbable that, within any appreciably restricted period, the cumulative effect of such changes will be so marked as to render their consideration a matter of present necessity. The suggestion is confirmed indeed by the figures of the table referred to, which show that since the enumeration of 1891 the order of density among natural divisions has remained unaltered, while changes in district position have been so slight as to be for practical purposes immaterial.

19. The figures in the margin show that, with the exception of the decade 1871-1881, in which occurred the great famine of 1877, progress in regard to density has been fairly constant for a number of years: and such progress may be accepted as an indication that the question of overpressure of population on the land is not as yet one of practical emergency. In support of, or at least in relation to this argument, there are certain lines of enquiry, which may be pursued with a view to ascertain how far the density of certain representative districts or taluks has reached a point beyond which further progress is unsafe, if not impossible; and whether a surplus population at one point can be utilised to supplement an apparent deficiency at another. For our purpose we shall need to anticipate the existence of succeeding chapters, in so far as to borrow some of the facts or theories which they set forth.

20. If man does not live by bread alone neither can he live without it; and in the last resort the population of a tract, at least in Madras, is mainly determined by the amount of food that its soil can and does produce. Here as yet the development of industry and of urban life is, and perhaps will for ever be, too small to demand consideration of a population which buys its food rather than produces it. Agricultural statistics set forth in subsidiary table I supply us with certain standards by which to estimate the present possibilities of each district.

21. I use the word "present" advisedly. As a guide to the future, the utility of these figures is vitiated by the vagueness of the terms "cultivable" and "cultivated."

22. Exclude sheet rock, sand, roads, rivers, uncleared jungle, and such like, and there is not much of the land's surface uncultivable; that on which something cannot be grown. The Deccan ryot, who hastily scratches a few inches of stony surface soil, throwing thereon some scanty handful of castor or millet seed, is a cultivator, equally in name if not in degree, with the careful Tamil, who assiduously ploughs, manures and weeds his securely irrigated rice field. From this same subsidiary table I it may be seen that if the districts be ranked, first in accordance with the proportion of their several areas considered "cultivable," and then according to area of actual cultivation, their respective places in each classification will differ widely. If going further we consider the nature of crop cultivated, we shall see that in those districts, whose density of population in respect to cultivated area is highest, density is as a rule proportional to the extent of rice cultivation. Thus South Canara, which stands fifteenth in point of density proportional to total area, stands second in respect of density proportional to cultivated area, and first in regard to extent of such cultivated area under rice. Similar figures for Chingleput will be six, four, and three; for Vizagapatam five, one, and eleven.

23. Or, in other words, the power of a district to support its population is determined by the quality rather than the quantity of its cultivable area, and modified by an intensiveness rather than by an extensiveness of cultivation.

District.	Rank according to	
	Density proportional to total area.	Increase during past decade.
Tanjore	1	23
Górávari	2	8
Kistna	14	5
Bellary	20	29
Anantapur	24	28
Vizagapatam	5	25
South Canara	15	22
Malabar	4	16

24. Tanjore, in respect to total area the most densely populated district of Southern India, in point of increase during the decade ranks but twenty-third among the Madras districts and states (excluding Madras city and Anjengo). For convenient reference the rank of a few typical districts in these two connections may be exhibited in the margin.

25. Tanjore supports its 2,362,639 souls on a cultivation of 1,331,941 acres. Of its cultivated area, the district irrigates 990,308 acres, and of this 836,282 acres from Government canals. Its cultivation, apart from the quality of the cultivators, may therefore be assumed as potentially good; and from the fact that in respect of population proportional to cultivated area the district stands but sixth in the presidency, with an average density of 1,135 persons per cultivated square mile, we may deduce that, whatever be the cause of tardy increase, over-pressure of population on the soil is not primarily responsible.

26. Vizagapatam, with 1,549 persons per cultivated square mile, and a small percentage of increase during the decade, is more liable to the charge of over-population. Its rank in respect of density proportional to total area is somewhat surprisingly high, inasmuch as no more than 37·8 per cent. of its extent is claimed as fit for cultivation. At the same time of such cultivable area as it possesses it utilises but 62·7 per cent., and has therefore a sufficient margin on which to fall back. Although not an irrigation district in the sense in which the term may be applied to districts commanded by the great canal systems, such as Tanjore, Kistna, and Górávari, it yet, with a normal rainfall of 40·88 inches per annum, manages to devote an appreciable percentage (31·6) of its cultivated area to the production of rice. It is however possible to push too far this theory as to the intimate connection between density of population and extent of rice cultivation, as the following figures will show. The Ganjam agency, twelfth in rank as regards population per square mile of cultivated area, has but 34·6 per cent. of such area under rice; the agency of Vizagapatam, with rice growing on 58·2 per cent. of its cultivated land, occupies but twenty-fourth place in the same classification.

27. Bellary twentieth district in point of density proportional to total area, and lower still if population be considered in relation to cultivated area, requires 2,425,557 acres for the maintenance of its 969,436 inhabitants. Górávari uses 822,367 cultivated acres for 1,445,957 persons; Anantapur requires 1,928,633 acres for a population of 963,223. By further reference to subsidiary table I we find that Tanjore claims but 72·6 per cent. of its surface as cultivable, against the 77·5 per cent. of Bellary: of its cultivable area it utilises some 9 per cent. less than the thinly populated Deccan district. Górávari has 72 per cent. of its area capable of cultivation, and of this extent cultivates over 70 per cent. Anantapur at the bottom of the scale can cultivate 69 per cent. of its total area, and turns to account more or less profitable over 66 per cent. of its opportunities.

28. While the examination already made of figures relating to Tanjore gives ground for belief that density of population in the district has not as yet assumed the characteristic of dangerous over-pressure on the soil, the argument of Chapter II suggests that no appreciable advance in the percentage of decennial increase need be expected. Bellary and Anantapur, for all their popular leanness, we may deem unlikely to attract a much closer settlement. In point of increase during the past decade their respective positions (29th and 28th) are lowly; twentieth and twenty-fourth in point of population related to total area, their rank (29th and 27th) in respect of population proportional to cultivated area is lower still. If

the argument of Chapter III, paragraph 3, be accepted, the sources on which they could draw for immigrants—the remaining Deccan districts—are in no better case than themselves.

29. Of the other districts selected Górávari, and still more so Kistna, in the East Coast Northern division appear to exhibit certain potentialities of increase. Second in regard to absolute density, Górávari ranks eighth in point of increase during the decade, and eighth in respect of pressure of population on its cultivated area. Of its 531,772 irrigated acres 378,299 are irrigated by Government canals, a source which in Kistna feeds 812,628 acres out of a total of 896,540. The latter district, which with a population of 1,997,535 stands fourteenth in the Presidency in point of density, and fifth in respect of progress during the decade, has as yet but 742 persons per cultivated square mile; a proportion less than half that of its northern and less fertile neighbour Vizagapatam. Malabar, fourth and third in regard to the two standards of density hitherto adopted, stands sixteenth in point of increase. It now supports the largest population of any district in the Presidency (3,015,119) * on the cultivation of 55·5 per cent. of its cultivable area, which latter amounts to 63·6 of the total extent of the district. For its irrigation it depends on rain; with a normal rainfall, of well-nigh 117 inches per annum it may well do so.

30. Subsidiary table II shows the talukwar distribution of density throughout the Presidency and in the natural divisions, while subsidiary table IV, Chapter II, shows the percentage of increase in each class of taluk throughout the decade. From the first of these statements it may be seen that taluks with such low densities as 0–100, 100–150, and 150–200 per square mile, occupy a very considerable proportion of the area of the Presidency, and that a greater density than 500 persons to the square mile is comparatively rare. The second statement shows that on the whole increase has been greatest at the weakest point, although for reasons to which allusion will be made in the succeeding chapter, the reality of increase in the Agency division is open to some suspicion. A further proof of the theory already advanced as to the ability of Madras to support its present population is afforded by the figures in column 10 of this table, which show that even in the most densely populated areas increase has been by no means inconsiderable.

31. Following the principle hitherto adopted of dealing with a few representative districts taken from each part of the Presidency, it may be of interest to exhibit the density of some districts and their taluks in greater detail.

District.	Number of taluks.	100 to 150.	150 to 200.	200 to 300.	300 to 400.	400 to 450.	450 to 500.	500 to 600.	600 to 700.	700 to 750.	750 to 800.	800 to 900.	900 to 1,000.	1,050 and over.
Tanjore	11	...	...	1	2	...	...	...	1	2	2	...	2	1
Górávari	8	...	...	...	1	...	...	4	...	1	1	1	...	...
Anantapur	9	5	3	1	...	...	...	...	...	...	...	...	...	...
Bellary	9	2	6	1	...	...	...	...	...	...	...	...	...	...
Kistna	13	...	1	6	1	1	1	1	1	1	...	...	...	...
Malabar	11	1	...	...	...	2	2	...	1	2	...	...	...	3

32. Of the taluks whose density far exceeds the customary limit of the Presidency that in the Tanjore district is the Kumbakónam taluk. Malabar has three such; but such is the varying nature of the country that the density found in Ponnáni taluk, which averages more than 1,200 persons to the square mile, is not considered as representing unfairly the state prevailing with 10 miles of the sea board

* Unless Vizagapatam and its agency tracts be considered as together forming one district.

throughout the district. At the same time, as may be seen from Chapter II, here, if anywhere, the shoe of population pinches, or is in the near future likely to pinch, the foot of accommodation.

33. *Houses*.—Although in the mild climate of Southern India shelter from the elements is not of such paramount importance and necessity as in more inclement lands, yet man needs some sort of abode wherein to bestow himself and his belongings; as a gregarious animal he congregates in villages, cities, or towns.

34. A house was for census purposes defined as “the residence of one or more families, and having a separate entrance from the common way.” This definition includes alike Government House and the Paraiyan’s hut; but all embracing as it may appear difficulties would now and then arise. On the census night I sought perplexedly the residence of one Muniyan in a city *parachéri*: a friendly neighbour banged against a sheet of tin, which leant against the side wall of a cabin, and forth on all fours came Muniyan. His lair was certainly his residence, and it had a separate entrance from the common way—two in fact, one at either end. But it is a nice point whether it could be considered a house.

35. The description of a standard Indian house in various districts has been so often given that its repetition here is needless. Nor indeed is there any one description that will include alike, (at least as regards external appearance), the isolated farmstead of Malabar, the cottages of the eastern village street, and the city lodging house.

36. From statistics such as those given in subsidiary table VII showing the number of houses per square mile, and average number of inmates per house for each natural division, there is little inference to be drawn. Fifty houses scattered over a square mile represent ample accommodation, but exactly the same statistical result is given by fifty houses huddled together in an inappreciable fraction of the same area.

37. The stately homes of the Presidency number 7,916,490, a figure which represents an increase of approximately 10 per cent. since 1901. House room has therefore increased more rapidly than has population; but theories as to relief of overcrowding based on a foundation so indefinite as the nature of the Indian house are of somewhat problematical value.

38. In the fact that, whilst population and houses increase, the average number of persons per house shows little or no change, it may be possible to see some trace of the individualistic tendencies of to-day, which favour disappearance of the old Hindu joint family system. This system has been assumed by lawyers * as the normal condition of the Hindu family; the assumption has been vehemently combated by Mr. J. H. Nelson.† As to the correctness of either view it is not for me to decide, but there can be little doubt as to the practical truth of the following words: “It is an undoubted fact that year by year thousands of Hindu families resident in the Madras Province are in effect permanently broken up, by one or more members going to a distant place or to distant places, he or each of them hoping to make a fortune for himself solely. The pressure of poverty, the love of adventure, and the desire to escape the terrors of the law, are constantly operating powerfully on many thousands of individuals in this part of the world as elsewhere, and the informal division of families is rapidly becoming a common occurrence in every part of Madras.”

39. The question becomes more real if considered in relation to the larger cities; and in Madras city, house accommodation has increased by more than 7 per cent. in comparison with a rise of less than 2 per cent. in the population. The improvement here is in all probability real, as the trend of population and building alike in Madras is from the old city proper in the north to the open spaces on the southern side, where new buildings required for the increasing population must now be erected under some measure of sanitary supervision and control.

* “Joint undivided family is the ordinary status of the Hindu”—Norton’s “Leading Cases.”

† “A View of the Hindu Law”—J. H. Nelson.

40. At the same time there are some few other indications that a real improvement is in progress. An increase in general urban population between 1891 and 1901 of 25 per cent. outstripped by 4 per cent. increase in urban accommodation, while increases in village population and in houses available, or at least occupied, were exactly equal at 5 per cent. In the decade now under consideration the urban and village increase of occupied houses surpasses, albeit slightly, the urban and village increase of population.

41. *Village*.—A “village” is the unit of revenue administration, and the word used thus does not necessarily connote material existence or present habitation. In the Agency tracts, especially, there exist numerous “villages,” in which no one now resides. Clubbing and splitting of villages for revenue purposes is an every day feature of settlement; the revenue village may frequently include two or more residential villages; or on the other hand a village, to all outward seeming one and indivisible, may enjoy a theoretically dissevered existence.

42. It is therefore idle to draw conclusions from increase or decrease apparent in the number of villages existing at successive enumerations. For the little that

					Number of towns and villages.
1911	...	...	...	...	54,623
1901	...	...	...	...	55,423
1891	...	...	...	...	57,596

they are worth I give the marginal figures.

From the figures of subsidiary table III to this Chapter it is abundantly clear that the Madrasi is a village dweller.

Even in the East Coast southern division,

which contains five of the largest cities in the Presidency, 841 per 1,000 of the population live in villages, and of these the majority in villages with a population ranging from 500 to 2,000. Town dwellers are still fewer in the central division of the East Coast, which contains the capital of the Presidency, and the predilection of the rustic for a comparatively small village is still more strongly marked.

43. Subsidiary tables V and VI give certain particulars as to the towns and cities of the Presidency. Of the latter the Province claims thirteen, of the former two hundred and sixty-seven.

44. With the term “city” one is apt to associate certain external appearances: broad streets of substantial shops, cheap and ready methods of communication (tramways, etc.), considerable public buildings, factories and marts. In the statistics of a city one looks to find a certain density of houses and population, in India an excess of males over females, a high percentage of immigrants, and of literacy. Judged by these standards it is permissible to question whether the Southern Presidency, despite the wealth of information afforded by the subsidiary tables and Imperial Tables VII and VIII, in truth possesses a “city.” The capital itself suggests but faintly

“The citys congregated peace of homes and pomp of spires”

and in such loose aggregation of villages as Salem and Cuddalore one scarcely discovers any peculiarly urban characteristics.

45. Taking however possession of 50,000 inhabitants, the criterion adopted to this census as a valid claim to “cityship” in Madras, the first noticeable point is that Coimbatore and Bellary, though included, have fallen below the required standard, while the population of Salem has noticeably decreased. Herein is but the effect of a cause to which further allusion will be made in Chapter II; namely temporary evacuation induced by plague. Conjeeveram and Cocanada have joined the ranks; and indeed the bustle of the latter’s port, and its apparent attractiveness to immigrants do something to justify a claim to inclusion.

46. The striking increase of Madura, in external appearance not altogether uncivil-like, is undoubtedly due to industrial development, especially in the line of weaving; an inference strengthened by the reversal of the proportion of the sexes during the decade. In a lesser sense the same may be said of Trichinopoly, headquarters of a considerable railway system. Kumbakonam claimed by its friends as the Cambridge of the South, and of more equivocal renown in Tamil slang, strives and thrives apace through the decade despite occasional municipal misadventures;

but, though both have increased in absolute numbers, the strenuous hum of city life is hardly apparent to the visitor to Tanjore and Negapatam. If the projected transfer of the South Indian Railway workshops to Trichinopoly takes place, it is not unlikely that Negapatam will in the forthcoming decade fall from its present estate.

47. Statistics of density and literacy in cities are also included in subsidiary table VI. Certain abnormal variations in regard to density, such as may be seen in the cases of Kumbakónam and Calicut, are to be accounted for by survey revision of the areas of the cities, or by disregard of a fraction lower than .50 in making the calculation. In point of literacy the percentage, as might be expected, is higher than that of the surrounding country, but in no case even among men does it reach 50 per cent. of the total population, while the literacy of women is still practically a negligible existence.

48. The religious distribution of the urban population is seen in subsidiary table IV. The figures therein found, which show that of the three main religions of the Presidency Muhammadanism is in proportion to its total following most strongly represented in urban life, are of little added interest to any one acquainted with local circumstance. Save on the West Coast, where his proportion of town dwellers is at its lowest, the Muhammadan is rarely an agriculturist; trade, and the minor handicrafts which the poorer brethren affect, require a somewhat larger field than that afforded by the village community for their convenient and profitable exercise.

49. Of rather more general interest appears to be the fact that urban life, in so far as it exists, is markedly the characteristic of the Tamil. Of 13 cities all but three belong to this people; of 280 towns and cities combined, with a population of 4,919,476 souls, 165 supporting 3,162,764 persons are in the Tamil country.

50. "*Towns*" as defined for census purposes included all municipalities and cantonments, and "every other continuous collection of houses inhabited by not less than 5,000 persons, which the Provincial Superintendent may decide to treat as a town." Local consideration suggested the inclusion of some additional 10 towns, which do not fulfil these conditions.

51. On this basis the Presidency now contains 267 towns exclusive of cities. Some few more villages were tentatively included in the list as likely to fulfill the requisite conditions; but subsequent consideration led to their exclusion.

52. A few instances have been given of cities which are in the main but aggregations of villages. Distinction between village and town is still more difficult, many so-called towns differing in nothing save in number of inhabitants from their rural neighbours.

53. Between 1891 and 1901 the urban population of the Presidency increased by 25 per cent., as compared with an increase of but 5 per cent. in the rural population. The decade which has just concluded has witnessed a considerable change, urban increase having fallen to 15 per cent., while that in the countryside has risen to 8 per cent. The marked increase in urban population between 1891 and 1901 was explained in the latter year as in all probability due to the attraction of higher wages, and greater freedom from caste restriction offered by town life; but if this explanation were correct the drift towards the town might have been expected to continue. A more probable explanation is perhaps to be found in the contrast between the agricultural possibilities of the two decades described in Chapter II; a succession of favourable seasons, by rendering the work most congenial to the Indian villager fairly abundant and certain, must have to a large extent arrested the townward quest of work. Caste fetters, which may gall an infinitesimal minority, whose oriental conservatism is in some sort disturbed by the influences of western culture, sit lightly, as will be suggested in a later chapter, on the vast majority of the people, to whom these strange restrictions serve as natural and convenient guides of daily life.

54. A striking feature of the change between the decades has been the practical cessation of increase in the City of Madras. On the census of the capital city the liberality of the Municipal Corporation has enabled me to publish a special report, and therein the attempt has been made to give detailed reasons for results, which, it must be admitted, came as a surprise to most people. Recapitulation is needless, but the greater potentialities there suggested of extra Indian emigration, as compared with movement from village to town, or district to district, may be taken as of some general application throughout the Presidency.

55. Subsidiary table V gives, in somewhat complicated form, information as to the rate of progress throughout a considerable number of years in towns classified in accordance with size. From the fact that increase appears greatest at the lowest end of the scale may be drawn confirmation of the opinion, suggested in paragraph 28, that the Madras town is in most cases nothing other than a somewhat overgrown village.

56. Imperial table IV shows decennial variations of every town in the Presidency. To labour through each item therein set forth would be a long and, on the whole, unprofitable task. Fluctuations apparently violent can be in many cases explained by alteration of area and exclusion of outlying hamlets, as in the case of Dharmavaram, and other towns of Anantapur, or of Gúdúr in the Nellore district; by occurrence or non-occurrence of religious festivals at the time of enumeration, as in the case of Tiruvottiyúr; by plague scare, or recovery from plague scare, as in the cases of Salem, Coimbatore, Tiruppattúr, and Vániyambádi. The contrasted figures of the latter two towns are especially interesting, inasmuch as in 1901 Vániyambádi had lost much of its population to Tiruppattúr, while in the decade that has just concluded its emigrants have returned. Mangalore, to some extent affected by plague, does not as yet seem to reap the full benefit of railway connection with the rest of the Presidency; Tellicherry and Cannanore on the West Coast extension have doubled the increase of the preceding decade. An increase of 2,616 in Masulipatam, against one of 698 between 1891 and 1901, indicates the presence of a new railway connection with Bezwáda, which has itself added nearly 9,000 to its strength. Guntúr advances steadily: Berhampur at the northernmost end of the Presidency, after standing still between 1891 and 1901 has gained 5,727 new inhabitants; Tuticorin in the extreme south has increased by more than 12,000.

CHAPTER II.—MOVEMENT OF POPULATION.

THE title of this chapter implies that variation in the population of the Presidency, due to the working of the natural forces, birth and death, as well as to the more mechanic influences of emigration and immigration.

2. Even were trustworthy materials available for the work, it would be of little interest to draw a comparison between such happenings in bygone days and in the present century. The shadowy conflicts of Pándiyan, Chóla, and Chéra dynasties, the nose-cropping forays of Tirumala and his peers, the glory and downfall of Vijayanagar and Madura, are unrealisable in contrast with the carefully recorded monotony of to-day, when Meicondan has left his forest home for the more efficient atmosphere of the law courts.

3. Statistics as to the religions and occupations of some forty-two million people, based on the enquiry of a single night, imply a sufficient deprecation of their own existence. But if the numbering of the people shows anything in truth, it must show the number of people actually existing at a particular moment in 1911; which may safely be compared with that of those existing at some fixed time at each previous decade. For although all figures may be, and probably are, inaccurate, it is on the whole unlikely that the percentage of inaccuracy has latterly varied to any very significant extent from decade to decade.

4. If then this chapter's discussion were to proceed merely by showing the positive figures of increase or decrease for the Presidency, or even for each district and each city, the ground would be firm enough. But such method would show nothing beyond what one might naturally expect, namely that in a decade unmarked by any great or widespread natural calamity there has been a certain increase.

5. There are certain figures and returns in the light of which the crude census totals may be examined: in Europe the examination to a few, and its results to many, are interesting and valuable. Such are statistics relating to births, deaths, age or marriage.

6. Marriage registration in Southern India does not exist, and it has hitherto been customary to doubt whether that of births and deaths can be seriously regarded. The village officer, source of all Indian information, is the recorder of his village, and it well may be that, amid the toils of keeping accounts and collecting *mamuls*, he pays scant heed to what he and his friends consider the idle curiosity of an eccentric Sircar.

7. Still of more concrete value than speculation as to the workings of the village munsif's tortuous soul will be some figures, extracted from the vital statistics of the Presidency, and compared with those disclosed by the census.

8. The census of 1901 was taken on March 1st, that of 1911 on March

Increase shown by	Total.	Males.	Females.
Registration ...	2,797,197	1,435,021	1,362,176
Census ...	3,175,780	1,531,641	1,644,139

10th; statistics of birth and death are compiled according to the calendar year. For all practical purposes the slight difference between the two periods may be ignored and the increases according to both calculations contrasted as in the margin.

9. When we remember that registration is not enforced over the whole area of the Presidency, it seems but natural that the census increase should exceed that shown by registration. The difference is small (378,583), and the registration figures of Madras, when examined with reference to those of India, contain a certain

inherent probability of accuracy. The total excess of census over registration in India is 2,361,658, and this excess is accounted for almost entirely under the head of males (1,866,735). This condition is reversed in the case of Madras, where the excess is mainly on the female side (281,963); a state of things rendered entirely probable by the reluctance of the Madras parent to proclaim abroad the advent of a daughter.

10. But at the same time there is something to be said on the other side. Roughly speaking, all persons aged 0—10 at the census must have been born in the registration decade under reference; age is rarely accurate to a couple of months in India. To obtain the deaths among those so born, a certain amount of calculation and adjustment is necessary, in order to avoid inclusion of the deaths of children born prior to 1900. The method of this calculation is somewhat too long for detailed exposition; its result gives us 3,081,539 deaths (males 1,621,922, females 1,459,617) among this particular section of the people. The results of registration

Number of	Total.	Males.	Females.
Births during decade.	11,314,152	5,777,672	5,536,480
Deaths at 0—10 ...	3,081,539	1,621,922	1,459,617
Survivors aged 0—10.	8,232,613	4,155,750	4,076,863

may then be summarised as in the margin; while those returned on the census night as at the age period 0—10 are as follows: total 11,137,786; males 5,495,796, females 5,641,990. The surprising difference between the two sets of statistics at their commencement,

contrasted with their practical coincidence at the close, can be explained, and the explanation helps us to a just estimation of the worth of the vital statistics and of some aspects of the census returns. In the first place, as these figures suggest, registration of deaths is undoubtedly far more accurate than that of births. A birth to the simple Indian is a matter of no importance; he has not grasped, nor probably heard of, d'Ivernois' method of estimating the worth of a government, and the happiness of its subjects, by the contrast of the number of children born with the ages at which such children die. But a death is a different matter. Even in a country village disposal of an adult body cannot be overlooked; while neglect of an infant death affords too obvious an opening for the enemy's false case to admit of carelessness. In the second place the accuracy of census age-returns, as will be noted in a succeeding chapter, is open to very considerable suspicion. Especially is this the case in regard to girls unmarried between the ages of 10 and 15; there can be little doubt that many such have been returned as under 10 though in reality considerably older.

11. But granting a certain accuracy to the registration of the fact of death, this accuracy serves us little for the purposes of the present chapter, if unaccompanied with a certain measure of probability in the recorded causes of death. Here adaptation to European terminology of the traditional classification of all maladies as "hot" or "cold," is apt to drive the *vaidyan*, expert adviser of the village registrar, to the all-embracing classification of "fever," a fairly regular concomitant, it must be admitted, if not immediate cause of death in the East. Thus of a registered total of 4,342,651 deaths in the decade, 2,920,761 have been ascribed to fever. For more conclusive arguments as to the causes of movement in the population we must fall back on cholera and plague, both fairly easy of identification.

12. The average annual mortality from cholera for the decade has been 61,689; an average which, if we exclude the epidemics of 1901 and 1906, 1907, 1908, when deaths from this cause numbered 81,370, 142,811, 81,565 and 141,970 respectively, sinks to 28,196 per annum for a period of six years.

13. Plague—fortunately a rare visitant in Southern India—claims an annual mortality of 6,887. Without the deaths

Years.	Salem.	Coimbatore.	Bellary.
1911	59,153	47,007	34,956
1901	70,621	53,080	58,247

of 1902 and the two succeeding years, (a total of 44,211), this average would be but 3,522. But the effect of a recurrence of plague at the time the census was taken is but too evident in a contrast of the

figures of 1901 and 1911 for the cities Salem, Coimbatore and Bellary.

District.	Increase per mille of population.

Under 1	1,086,361	936,373
10-15	161,733	145,614
15-20	148,194	182,636
20-30	314,385	385,308
30-40	350,668	330,145

disfavour of the latter, which commences at the period 15-20 and ends at the period 30-40. Of both phenomena an explanation may be found in the universality of marriage, and of marriage too often untimely and unprovident. The subject will be treated more fully in Chapter VII ; but Southern India seems hardly to recognise as yet that the national desideratum is not a huge number of random marriages, with a consequent horde of children absolutely certain to die off like flies, but a steady keeping up of numbers at an efficient age.

16. Immature maternity can but result in sickly children, and physically injured mothers. And even with all allowance for the inevitable risks of motherhood, the contrasted death figures for the sexes at the normal child-bearing age of women suggest that there is here a vast amount of wastage and preventible misery. The following words from an acknowledged authority are worth attention :—

“ Midwifery in India is still in an awful condition. It is the common habit and custom in almost all districts to hand over the women in labour to the care of one of the dirtiest, most backward, illiterate, ignorant and superstitious classes, the barber midwife. The result of this custom is that untold misery, and unnumbered unnecessary deaths, are meted out to the parturient women of this country by these untrained and unclean practitioners. I do not exaggerate. Every medical practitioner in this country will substantiate this statement.

* * * * *

“ If a nation is to be judged, as some hold that it should be judged, by the way women are treated, then India’s place on the list of nations must indeed be very low.” *

Decade.			Increase per cent.
1901-1911	...	...	8·3
1891-1901	...	...	7·2
1881-1891	...	...	15·7†

17. Abandoning vital statistics we may glance at certain natural conditions and mechanical changes of the last decade and of that preceding. Interwoven with these reflections may be a consideration of the general increase in the population disclosed by succeeding enumerations.

18. The abnormal increase of the decade 1881-91, is easily explicable as the rebound following on the terrible famine of 1877-78. Its diminution in the succeeding decade may indicate a return to more normal conditions ; the improvement disclosed by the last census, while partly due to the fact that, owing to the heavy child mortality of the great famine, the number of persons at reproductive ages during

* Lt.-Col. Giffard, I.M.S., at the opening of a new Medical School in connection with the Maternity Hospital, Madras.
† Taken on unadjusted area of the Presidency.

the decade 1891–1901 was probably somewhat low, may also suggest that the Presidency is settling down to a jog-trot of prosperity.

* 19. This opinion however may be accepted with some reservation. In his report on the decennium 1891–1901 Sir Frederick Nicholson describes it as “one of almost uninterrupted bad seasons”; his analysis of the facts on which he bases this opinion may be quoted in full.

“Although the decade which ended in 1890 had been on the whole one of favourable seasons, it closed gloomily owing to widespread failure of crop over the greater part of the Tamil districts, and in some parts of Cuddapah, consequent on a failure of the north-east monsoon rains of that year: and though the strain was in part removed by rain in January 1891, yet in March of that year an area of 7,600 square miles was so far affected that relief works and relief kitchens were opened in several districts. As the year wore on, and the usual south-west monsoon rains were delayed, and to a large extent failed, distress was prolonged and intensified, though relieved by the later rains, which were generally good in the southern half of the Presidency. In the Deccan districts and the northern part of Nellore, however, distress deepened into famine, and at the end of March 1892, an area of 22,700 square miles with a population of $3\frac{1}{2}$ millions was in distress. Relief operations were carried on from February 1891 to September 1892; the largest numbers on relief being an average of 88,681 workers, and 1,094 gratuitously relieved, in June 1892. The cultivating season of 1892 was, on the whole, favourable in the northern half of the Presidency, but in the extreme south, owing to a phenomenal failure of the north-east monsoon, much loss of crop ensued; but the pressure was mitigated to a large extent by the migration of the people to favoured localities, and later on, in March 1893, by copious showers. The next two years were, on the whole, favourable, but the season of 1895, not so much so; and it closed with unfavourable late rains. Notwithstanding this, in June 1896 prices had receded from the high level caused by previous unfavourable seasons, and were becoming normal. In that year, the south-west monsoon set in fairly; but the rainfall of September—the most critical month of the year—was scanty over the Deccan, parts of North Arcot, and in the Circars. The north-east rains were copious over the south of the Presidency, but in the northern half extensive local failure of crop occurred, which, coupled with the demand for grain in other parts of India, forced up prices at a time when the demand for labour was reduced to a minimum. Relief operations again became necessary, and in March 1897 an area of nearly 16,000 square miles with a population of more than $3\frac{1}{4}$ millions was affected. These operations were continued far into the year, and in July there was an average of 557,719 relief workers employed, besides 215,495 persons relieved gratuitously, and relief was not closed until November. It was continued so far into the year owing to the delay in the proper setting in of the rains of 1897, especially in the Deccan, for elsewhere, although rather late, the early rains were favourable. The later rainfall was, however, a general failure, and the rains ceased early, causing much injury to the crops, and this necessitated the granting of some relief in Nellore up to July 1898. In 1898, the early rains were abundant, and though those of the south-west monsoon were rather late in beginning, they were generally good, and the season was, on the whole, favourable. In 1899 again the early rains were copious, but those of the south-west monsoon were extremely deficient, over the greater part of the Presidency. Later on, however, the rainfall was generally good, and the season was favourable as a whole, except in parts of the Deccan districts, but at the beginning of 1900 an area of 6,500 square miles, with a population of about a million, was so far affected as to claim the closest attention. The cultivating season of 1900 opened favourably, and the rains of the early part of the south-west monsoon were good, though there was a considerable deficiency in August; but September was favourable though the north-east monsoon was deficient and ceased very early.”

20. Fortunately the decade that has just closed offers no parallel to this

DATE ON WHICH RELIEF		Number of persons relieved.	Direct cost.

and a poorhouse were started in Chingleput the extent and cost of relief operations being as noted.

somewhat gloomy record. An unfavourable agricultural season in 1904–1905 resulted in a certain scarcity in Chingleput, Nellore and Kurnool; but from reports published on the subject it appears that distress was neither very serious nor very widespread. I was myself in Kurnool, (or Banganapalle State to be more accurate), at this time, and though the year was bad nothing like a famine prevailed. Test works

DATE ON WHICH RELIEF		Number of persons relieved.	Direct cost.
Opened.	Closed.		
March 1st, 1908.	October 22nd, 1908.	78,753	Rs. 12,911

Note.—Each person is counted separately for each day relieved.

21. In 1908 distress prevailed in the Ganjám district, being localised chiefly in the Khond and Savara villages of the Peddakimedi Zamindari, the Mohiri Khond villages of Berhampur taluk, and a tract lying north of the Rushikulya river. Relief afforded in the form of works, poor houses and famine kitchens is summarised in the margin.

22. Ganjám suffered further misfortune in the shape of a heavy cyclone on October 26th, 1909. About 873 villages were affected, in which some 11,000 houses were destroyed, and 20,000 injured; the value of the damages being estimated at Rs. 4,00,000. Crops and gardens suffered to an extent of about Rs. 3,00,000; about 2,000 cattle, sheep, and goats were killed, and 62 persons lost their lives.

23. It may be that the diminution of increase in 1901 was to some extent real, not merely comparative; but the distresses of that decade were probably not so marked in their effects as to produce anything in the nature of a rebound in that which succeeded. Discussion of this question involves examination of the age periods of the people, and may with advantage be postponed to Chapter V, which treats exclusively of this subject.

24. Extension of irrigation, of roads, and of railways, does not in a land long and closely settled, and one whose social customs afford a barrier well nigh impenetrable to colonization from without, indicate such actual or potential increase in the population as in a land which still relies for its development on the advent of the colonist. Yet figures relating thereto may be quoted for what they are worth, as showing a progressive adaptation of the land's surface to the needs of a larger population. Extension of irrigation is a potent safeguard against the vicissitudes of seasons; if it be objected against railways and roads, especially the former, that they tend to destroy the habit of grain storage against an evil day, it is a fair answer that they also equalise distribution, and, as between province and province, or district and district, prevent co-existent extremes of plenty and scarcity.

25. The following figures exhibit the development of irrigation at various periods—extents are given in square miles:—

Source of irrigation.	Average, 1884-1885 to 1889-1890.	Average, 1890-1891 to 1899-1900.	1900-1901.	1903-1904.	1910-1911.
Total ...	9,444	9,137	9,330	9,756	15,505
Government canals ...	3,972	4,067	4,378	4,388	5,421
Private canals ...	42	44	39	37	352
" Tanks ...	3,569	3,098	2,939	3,381	5,635
" Wells ...	1,494	1,705	1,730	1,677	2,200
Other sources ...	367	223	244	272	1,897

26. Prophecy in this connection is an essay of doubtful value, but the figures at

—	Area commanded (acres) 1910-1911.	Ultimate area (acres).
Górávari delta ...	744,992	765,730
Kistna delta ...	711,275	725,000
Cauvery delta ...	902,769	919,540
Pennér river canal ...	151,679	165,385

the side give an approximate idea of the area now commanded by some of the great irrigation systems, and of the area which these systems may ultimately command. Obviously it does not follow that the goal will be reached by 1921; on the contrary, as these are old and already well tried sources, extension will probably be slow.

District.	Name.	Acreage.
Guntúr	Bhavanási	841
Nellore	Nopád	12,500
Kurnool	Venkatáparam	1,700
Vizagapatam	Nágavalli	31,200
Kurnool	Siddápúr	4,250

27. In respect of new irrigation it is possible that the projects referred to in the margin, or at least some of them, may have entered the sphere of actual existence when the next numbering of the people comes about.

Areas in square miles.

Year.	Total area cropped.	Area of food crops.	Area of rice crops.
Average, 1884-1889.	37,250	30,161	9,225
" 1890-1899.	41,647	33,278	10,255
1900-1901	43,506	34,859	10,300
1903-1904	46,125	36,289	12,139
1907-1908	59,353	46,771	16,559
1909-1910	56,857	44,919	16,187

28. Transition from these statistics to those of area cropped and details of crop is obvious.

29. It should be borne in mind that the abnormal development of later years is apparent rather than real, being induced by the inclusion for the first time in 1907 in these statistics of the figures for zamindari areas. To the same cause may be assigned the shrinkage of crop area in 1909-10, as compared with 1907-08. Statistics for the latter year, founded largely on estimate or guesswork, have assumed more reliable if more modest proportions three years later.

30. *Railways.*—There were in 1911 some 3,800 miles of railway serving the Presidency, as against 2,100 in 1891, and 3,500 in 1904. Although the decade shows no such important work as the line from Madras to Northern Frontier of Ganjám that marked its predecessor, mention may be made of the line from Bezwáda to Masulipatam, through the rich delta of the Kistna; extension of the West Coast line to Mangalore, the capital of South Canara; and the line which banished the nightmare jutka gallop (*experto crede*) from Dhone to Kurnool.

31. *Roads.*—There were at the end of the decade some 22,000 miles of metalled, and 4,000 miles of unmetalled roads in the Presidency. No new roads of great importance appear to have been laid during the decade. * Salem and Coimbatore, with nearly 1,800 metalled miles apiece, head the list; closely followed by Malabar with 1,603. Vizagapatam accounts for some 1,400 miles of metal, North Arcot for 1,600; Cuddapah, Madura and South Canara, have each more than 1,000 miles. This class of road, it may be observed, is not of paramount necessity in the "black cotton plains" of the Deccan and Tinnevely, inasmuch as in the dry season, when cartage is required, the fields themselves give going for bullock carts probably easier than does a permanent road of the type usually encountered in the mofussil. An increase of substantial highways, could such be built without prohibitive expense, through the irrigation districts of Kistna, Gódávári, and Tanjore, could scarcely fail to aid materially in developing still further the resources of these territories.

32. *Emigration.*—Figures relating to emigration and immigration are, for reasons described in the census report of 1901, a somewhat broken reed for the leaning of the statistician. In point of district detail, they are open to the special objection that the emigrant is almost invariably described as a native of the district wherein his port of embarkation, or the dépôt at which he arranges for his passage, is situated. Thus in the figures available of emigrants to Ceylon, Salem, Coimbatore, and North Arcot, to give a few examples, are unrepresented. But a statement compiled for me by the representative of the Ceylon Labour Commission shows that, in a period

* The figures that I have obtained are for districts as they stood prior to the introduction of Sir William Meyer's redistribution scheme.

of five years (1905-1909), 15,689, 8,246 and 11,694 persons respectively left these districts for the island.

33. Such information as I have been able to obtain shows a nett loss to the Presidency of 647,793 in ten years, as compared with one of 444,859 in the previous decade. For convenient reference I quote in the margin figures of emigration to those parts of the world outside India most affected by the native of Madras.

Emigrants from Madras to—					
Natal	...	...	...	...	45,740
Straits Settlements	...	...	...	...	447,036
Burma	...	...	...	...	1,160,522
Ceylon	...	...	...	...	1,501,623

34. It may be of some interest to give a few details as the castes of emigrants. For this information I am again indebted to the Ceylon Labour Commissioner, who at all times has spared no pains in complying with my manifold requests. In the five-year period above referred to there passed through his hands 42,493 *Paraiyans*, 28,596 *Pallans*, 15,759 *Kallans*, 13,738 *Vellálas*, 18,466 *Ambalakárans* and 9,753 *Agamudaiyans*. For the spiritual care of the wayfarers five *Bráhmans* had perforce to suffice.

35. It is obvious that much of this emigration is merely temporary, and by no means in the nature of permanent expatriation. The traveller to Ceylon is a harvester in the tea gardens of the island; the Straits Settlements call loudly for a few seasons labour in their rubber plantations; the rice mills of Burma are reported to be run well nigh entirely by Madrasi workmen, who in due course return to their native land. Burma appears to have given us back nearly 1,000,000, of her Madras emigrants, Ceylon 400,000, the Straits Settlements 266,000.

36. The pros and cons of this emigration question deserve perhaps a moment's consideration. Anxiety at depletion of the country's labour supply has been significant at sundry agricultural conferences, and has at times suggested governmental interference: of the manner of the coolies' going, the following description is sufficiently lachrymose:—

"Many thousands are shipped away to Penang every year for use in the plantations. Some are recruited by authorized agents, but the majority goes on its own account. Packed like sardines in a tin, sea sick and wretched, they make the five days' journey under conditions which would be intolerable to a white man. But the coolie takes it all with the mute philosophy of his kind, ready to endure anything and face anything for the sake of a few rupees, which may save his children from starvation, and his house from the clutches of the money-lender."*

37. Yet there is another side to this question. Probably nothing more than this outgoing has helped the Indian Paraiyan† to realise that cultivation of his high caste neighbour's land for a precarious handful of rice is not all that life has to offer: if his race suffers hardships in some of these new lands, he can at least murmur with some measure of satisfaction to his more aristocratic fellow sufferer "it is now unto thee as unto this last." A few figures may be given relative to the savings brought from abroad by returning emigrants, and to amounts remitted by them to their friends or relatives at home.

38. Between 1901 and 1910, 17,250 persons returned from Natal bringing with them Rs. 24,20,164; during the same period 2,225 persons remitted by money order Rs. 13,95,300. From Mauritius 2,659 persons returned with Rs. 13,127; from Fiji 35 persons remitted Rs. 3,515.

39. The voyage is probably quite sufficiently unpleasant. Yet returned emigrants whom I have questioned do not appear to find in it a subject for a tale of woe.

40. *Interprovincial migration.*—From the Superintendents of other provinces I have received information concerning more than one million persons born in the

* S. P. Hyatt. "Off the beaten track."

† At Negapatnam a Bráhman chided a Paraiyan who barged into him on the quay. To which the Paraiyan "I have taken off my caste and left it with the Port officer. I won't put it on again till I come back." I have heard of "depressed classes," or at least of depressed individuals, evolving into substantial farmers with the aid of the money earned and saved in foreign countries.

Madras Presidency, but enumerated elsewhere. When it is remembered that the Madras labourer frequently returns as his birth place his taluk or his village, rather than his district, and that a knowledge of the taluks, or even districts or provinces other than his own, is rarely possessed by the average enumerator, or abstracting clerk, the information supplied is somewhat remarkably accurate, "Madras unspecified" accounting for less than 20 per cent. of the total number.

41. Of provinces across the sea, Burma and Ceylon, as might be expected, account for the greater number of our emigrants. A remarkable variation in sex proportion is observable; of quarter of a million Madras emigrants to Burma, over 200 thousand are men; while in Ceylon, women contribute 182 thousand to a total of approximately 448 thousand. In the Burmese return "Madras unspecified" accounts for the major portion of those enumerated; but the districts, which claim the greater number of those whose birth-place has been ascertained, (Ganjám, Vizagapatam and Górávari), are certainly those from which emigration to Burma most prevails. Ceylon has returned the birth-places of its Madras immigrants with extraordinary accuracy, the majority coming, as one might expect, from the southern districts of Tanjore, Trichinopoly, Madura and Tinnevely. In the Straits Settlements were enumerated some 58 thousand Madrasis, among whom men outnumbered women in the proportion of four to one.

42. Of provinces or states within India, Mysore has taken from us more than quarter of a million souls (well nigh three times as many as she has given), with a fairly equal ratio between the sexes. North Arcot, with more than 57 thousand persons, is her largest contributor; closely followed by South Canara with nearly 49 thousand. Frontier contiguity is a readily apparent reason in the latter case as it is in the case of 52 thousand immigrants from Bellary and Anantapur; but an emigration of more than 41 thousand people from "Madras" indicates the difficulty experienced in obtaining a correct return of birth place. Travancore has enumerated nearly 50 thousand Madrasis, natives for the most part of the adjoining district of Tinnevely; of some 30 thousand found in Cochin five sixths came from Malabar. Sex proportion in these emigrants to Travancore and Cochin is practically equal, which suggests that the emigration may be permanent; but an overwhelming preponderance of men among the Madrasis found in Coorg, combined with the fact that practically all there found are natives of Malabar or South Canara, indicates the temporary migration of labour to the coffee estates on the plateau. Eastern Bengal and Assam account for 36 thousand persons, nearly all of whom come from the northernmost districts of Ganjám and Vizagapatam, to which labour recruiters for the Assam gardens look mostly for their workmen. Bombay shows some 35 thousand Madrasis, the greater number coming apparently from Madras City; but, as already noted, the opportunity for error, when the province and its capital possess the same name, is obvious. The figures for Hyderabad, I have not received in time for inclusion in this report.

43. So much for the Presidency as a territorial whole. Before devoting space to an analysis of the progress of the whole into the progress of its component parts, it will be well to glance at the movement of the four great religious sections into which the Presidency is divided.

44. The subject may appear one belonging essentially to Chapter IV, wherein indeed it is treated in some of its aspects. But that chapter deals with the progress of religion; increase or decrease among people professing a religion is more germane to this present train of thought.

45. The population of the Presidency has increased by 84 per mille during the decade. In the same period Hindus have increased by 81 per thousand, Muhammadans by 116, Christians by 163; while Animists have declined by 5 per mille.

46. Inasmuch as Hinduism is not a proselytizing religion, its only apparent possibilities lie in natural increase; and at the same time it is exposed to defections caused by Muhammadan and Christian conversions. Moreover, while Hinduism undoubtedly tends to absorb Animists, *en bloc* if not individually, a tendency which accounts for Animistic decrease during the decade, the theological whim

of the enumerator, exemplified in the case of the Nellore *Yánádis*, may sweep away abruptly a considerable number of its adherents.

47. Such are the efforts devoted to the spread of Christianity in India that its greater increase need occasion no surprise. Between Hinduism and Muhammadanism arises the question whether there is anything in the social habit of the latter religion more favourable to rapid natural increase. This question is usually answered in the affirmative; the reasons alleged for such answer being the more generous diet permissible to a Muhammadan, his freedom from the pernicious custom of immature marriage, and from sterile widowhood among his womenkind. There are however certain considerations which give ground for pause and reflection before a too implicit acceptance of this answer. As compared with the high caste Hindu the Muhammadan may eat meat; the express prohibition of his religion against intoxicating drink gives him an advantage over the Hindu of the lower sort. But, inasmuch as the rank and file of southern Muhammadans are not amongst the most prosperous, it is questionable whether they can afford flesh food to any great extent; and whether such flesh as they can procure has a more nutrient, or in any way better effect, than a grain and vegetable diet. On the other hand, abstinence from alcohol may be counterbalanced, it is feared, by the Muhammadan's greater predilection for intoxicating or narcotic drugs. •

48. In respect of avoidance of immature marriage, Chapter VII shows that the Muhammadan has the advantage of his Hindu fellow countryman, but it is questionable whether this is sufficient to counterbalance the harm that enforced seclusion of women must necessarily do to the community. In regard to female widowhood in general, and premature widowhood in particular, counsel is somewhat darkened by the fact that all Muhammadan widows may remarry, while the prohibition against remarriage is not of universal application throughout the several strata of Hinduism. Taking however 10,000 women of each religion, Hinduism has 1,892 of that number widowed against 1,745 of Islam: in point of premature widowhood the advantage is with the Hindus, whose widows aged 0—35 number 1,856 of 10,000 widowed, the corresponding figures of the Muhammadans being 2,029.

49. The better classes apart, occupation and residence are factors with some bearing on this question. As seen by Chapter I the Muhammadan, much more than the Hindu, is a town dweller; and the petty commerce and industry, in which he finds employment, is not in the nature of things so favourable to physical well-being as the country life and agricultural employment of the poor Hindu. An indirect confirmation of this view is obtained from the fact that among *Máppillas*, the agriculturists of the community, increase is considerably greater (139 per mille), than among the general body of Muhammadans. At the same time this increase as a natural happening needs to be discounted, in view of the greater activity in proselytism on the West Coast, of which Chapter IV makes mention.

50. The contrast of British territory with the feudatory states, whose statistics this volume includes, is of little interest.

—	Percentage of increase	
	1901-1911.	1891-1901.
British Territory	8·3	7·3
Feudatories	9·7	0·9

In comparison with their surroundings the extent and population of the latter are microscopic, and the marginal figures for the last two decades are too easily explicable to need lengthy comment. The unfavourable decade 1891-1901 told hardly on these little states, especially those of the Deccan, which showed a positive decrease; the slight increase of all three together being entirely due to the influence of the Pudukkóttai figures. The marked improvement of the last ten years is the obvious rebound after a season of adversity. Political comparisons and arguments, besides being objectionable, are in this case futile, inasmuch as, from a variety of causes, all three states were more or less directly under British control for a considerable portion of the last decade.

Natural division.	1901-1911.		1891-1901.	
	Rank.	Rate of increase per cent.	Rank.	Rate of increase per cent.
East Coast, Central.	4	8.0	1	9.1
East Coast, North.	2	9.8	2	8.8
West Coast ...	5	7.1	3	6.3
East Coast, South.	3	8.2	4	5.4
Deccan	6	3.8	5	5.3
Agency	1	16.7	6	2.4

51. Turning to comparison of movement in natural divisions and districts, it is essential to bear in mind the states precedent and subsequent to movement. In point of density the rank of the natural divisions remains unchanged from 1901, but in regard to rate of increase there has been considerable variation as the marginal figures show.

52. From the sudden acceleration of progress in the Agency division it would be unsafe to draw any conclusion. In point of density, this division with its several component parts is still at the bottom of the scale, and is likely to remain so. It is no doubt sparsely populated, but, from what I have seen of it, I should doubt if the land is capable of adaptation to the needs of an appreciably greater population, while its seasons of unhealthiness, and the peculiarities of its inhabitants, peculiarities probably less acceptable to the Hindu than to the European, render colonization unlikely. The greater progress of the decade may as probably be ascribed to better enumeration as to any other cause: this is especially noticeable in the case of the Vizagapatam Agency, which has changed from a decrease of 1 per cent. to an increase of 20 per cent., and where the Collector reports that some 245 villages, with a present population of 29,845, do not figure in the census returns of 1901.

53. Turning to the plains divisions, on whose statistics more reliance can be placed, we find the Deccan division low down both in actual density and in rate of progress. Two of its components, it is true, Banganapalle and Sandúr, in this latter respect outstrip the rest of the Presidency; but of this phenomenon an explanation has been suggested in paragraph 50, and is confirmed by the fact that Banganapalle, for the most part exceedingly fertile, is now but on a level in point of density with the adjoining district of Cuddapah, while the population of Sandúr per square mile is less than half that of Belary.

54. Conditions of life in Cuddapah, Kurnool, and Bellary are such as to favour a sparsity of population, and a slow rate of increase. Although holdings are larger than in the south, the farmer, whether he lives on the cholam that he grows, or buys food-stuff with the price of his cotton, requires a greater acreage for his livelihood than the rice grower. Individually the inhabitants of these tracts, in point of physical fitness, are probably equal to, or surpass, those of milder natural divisions, but the rigours of the climate, while bracing to the fit, do not favour the idle or physically weakly.

55. Examination in greater detail of vital statistics for the years 1901-10 shows that, taking the figures given for what they are worth, the birth rate of Cuddapah for each of the ten years was lower than that of the Presidency, as is that of Kurnool for eight of these years. In four years the death rate of Cuddapah was higher than the Presidency rate, that of Kurnool in six years. The birth rate of Bellary was higher than that of the Presidency in five years, but in every year save 1907 the death rate exceeded that of the rest of the Presidency.

56. This Deccan division is land-locked; and industry, as opposed to agriculture, tends to flourish in the reasonable neighbourhood of the sea. The same natural circumstance precludes to a great extent extra Indian immigration, which may temporarily deplete a district, but in the long run is apt to raise the general level of prosperity by the return of the emigrant in much better case than when he started. And the reluctance of the Deccan ryot to seek fortune elsewhere is exemplified in the story of the Kurnool Reddis, who, when invited to Heaven, made enquiries as to the extent of black cotton soil there to be found, and respectfully declined the invitation.

57. In the south-eastern division the birth rates of Tanjore and Tinnevely exceed that of the Presidency in every one of the ten years 1901-10; but

consequent increase is checked by a similar excess of deaths in every year in Tanjore, and in all save one in Tinnevely. The large emigration from Negapatam, already referred to, must exercise a potent influence in relieving overpressure in Tanjore, as does that to Ceylon in the case of Tinnevely. On the side of increase must be reckoned the inflow of money resulting sooner or later from this emigration, the well established industry and activity of Tuticorin, and the rapidly rising industrial importance of Madura city.

58. Malabar and South Canara, the main districts of the West Coast division, occupy 16th and 21st place in regard to percentage increase throughout the decade. In birth rate Malabar surpasses the Presidency average in seven years out of ten; South Canara excels it in eight years, and equals it in one. The death rate is higher in nine years out of ten in South Canara, and in five in Malabar. In point of population compared to cultivated area, these districts, as already noted, occupy second and third place respectively; which fact, combined with their comparatively slow rate of increase, may suggest that possibility of popular progress can only lie in enlargement of the proportion of cultivated to cultivable land. Although on the sea board, Canara and Malabar can hardly look to emigration westwards as an outlet for their surplus population; emigration to the east involves the crossing of India to a port of embarkation. Language and custom form a barrier to internal migration; the Malayali in particular, as seen in table XI, is reasonably loth to leave his own country, which has attracted a regular section of Tamil immigrants; who, though many of them have been born in Malabar, yet remain differentiated from the true West Coast people.

59. In the north-east division the slow increase of Vizagapatam, (4·2 per cent.), rendered credible by the position of the district in regard to density of population, is somewhat surprising in view of the abnormally low death-rate with which sanitary reports credit the district. The inhabitants may indeed observe with solicitude the précepts of the sagacious Vidura, and avoid "the rays of the rising sun, the smoky flame of the burning ground, the secret embraces of bad old women, the use of dirty water, the eating of curds and rice at night, wherein length of days slips away"; and may follow scrupulously his practical, but alas! unquotable regimen of daily life, but the probability is greater that something is amiss with these vital statistics. Of the abnormal increase in the rate for the years 1906 and 1908 I can find no detailed explanation; and although in eight years out of ten the birth-rate of the district was below that of the Presidency, the variation was not at all so strongly marked as in the complementary return.

60. To examine in detail the reasons for variation of population in each of the 250 and odd taluks, into which the Madras districts are divided, would require a separate volume. It must be remembered that the territorial redistribution of the Presidency has necessitated creation, by adjustment, of population for taluks, which in 1891 and 1901 did not exist; and alteration of figures for many, which, with an altered area, still retain their old names. The consequent necessity for discounting error is therefore so obvious as to require no further mention.

61. To the reasons for abnormal increase in the Vizagapatam Agency, or rather in parts of it, allusion has already been made. A decrease of nearly 27 per cent. in the Koraput taluk of the same district is considered by the Collector as genuine, and due to a large migration of Khonds to the points at which increase has been greatest. This migration is accounted for by (1) want of land for *pôdu* cultivation, the hereditary employment of the Khond, and the possibility of getting such land in Padwa and Nowrangapur taluks; (2) the nomadic instinct of the Khond; (3) want of capital (ploughs, cattle, etc.) for cultivation, which causes emigration as farm servants; (4) bad crops.

62. The Collector of Ganjám considers the greater rate of increase in his district, as compared with that in the previous decade, to be due to three general causes, to which he also assigns talukwar variations. These causes are (1) more accurate enumeration, (2) absence of epidemics and famine during the decade, (3) a favourable season in 1910-11, which induced many of the labouring classes, who usually migrate at harvest time to Rangoon and other places, to remain behind.

63. In Goomsur taluk a portion of the increase is attributed to the settlement of Khonds and other hill tribes in the plains; in Berhampur to settlement from outside for purposes of trade and agriculture; in Ramagiri (Agency) to immigration from Parlákimedi, caused by forest reservation operations in the latter area. In Chicacole taluk, where increase is lowest in the district, and lower than in the previous decade, emigration is assigned as the reason.

64. The Collector of Nellore considers as somewhat abnormal the rate of increase in Darsi, Kanigiri, and Podili taluks. These parts of the district appear to have suffered from scarcity twice in the decade ending with 1900; once in 1891-92, and again in 1898-99, with the result that labourers then left their homes in large numbers in search of work, and returned in the more favourable decade which followed. The same reason may be applicable to Udayagiri, where increase would have been greater but for a wave of bad public health, which also affected the neighbouring taluk of Atmakúr. Rápur taluk, which shows a decrease, contains several mica mines once employing a large floating population of labourers. Many of these mines, which were being worked at the time of census in 1901, had closed down, and such closure must have contributed in large measure to the decrease. In Atmakúr cholera prevailed at the time of enumeration; a slight decrease in Gúdúr, and a low percentage of increase in Polúr, Nellore, and Kandukúr are reported to be due to emigration to the Straits Settlements and elsewhere. Kovur is affected by malaria and general unhealthiness, and the tract was already somewhat congested in point of population.

65. In Bellary, a high percentage of increase in Alúr taluk is attributed to influx of labourers from neighbouring tracts at the cotton picking season. Bellary taluk has suffered badly from plague, a cause which may also account for lack of improvement in Hadagalli after the fall between 1891 and 1901; plague prevailed in Hospet, and large tracts along the river have been evacuated on account of the prevalence of malaria. Adóni was comparatively free from plague, but has lost several of its large villages to the newly constituted taluk of Siruguppa.

66. In respect of Kurnool the decade 1891-1901 was one of bad seasons; while during 1901-11 the district was comparatively prosperous. In bad years the inhabitants of the Cumbum and Markapur taluks migrate to the Kistna delta, and in a lesser degree to Kurnool, Nandikotkur, Nandyál and Sirvel, the canal fed taluks of their own district. The greater increase of these taluks, as compared with their neighbours, between 1891 and 1901 is thus explained, as is their diminished progress in the last decade. Pattikonda suffered severely in the scarcity of 1897, and its large percentage of increase now is probably the rebound after adversity. Dhone, which shows the highest rate of increase in the district (14·2), bears testimony to the value of railway extension, a line from Dhone to Kurnool having been opened during the decade that has passed.

67. In Guntúr the Collector considers the result of the census to be very much what might have been anticipated. Tenáli and Répalle taluks are commanded by the Kistna channels, and are markedly prosperous. Palnád taluk, where increase is smallest, is a stony and unfertile tract: increase in Vinukonda and Narasaraopet is possibly attributable in some degree to overflow from other taluks, where increase has been very marked for the last 20 years. As a whole the district is extremely fertile; it has been free from plague, and has not suffered severely from any other epidemic, nor from malaria.

68. Going further south the increase in five taluks of South Arcot, namely Chidambaram, Tirukkóyilúr, Villupuram, Gingee, and Tindivanam is assigned by the

Collector in the first place to certain general causes, such as (1) greater accuracy of enumeration; (2) freedom from epidemics and from severe famine; (3) decrease of emigration; a point noticed in the special report on Madras city. Secondly, increase has been greatest where ground-nut cultivation is most extensive, and the census was taken at the time of harvest, when a large number of immigrant coolies were employed. In Villupuram taluk the large railway works may partially account for an increase of nearly 5,000 in the population of the town, and exercise some influence on that of the taluk generally.

69. The Collector of North Arcot considers the marked increase in the Arkónam, Arni, Cheyár, Wálája and Wándiwásh taluks of his district to be due to the influence of a favourable agricultural decade, the season of 1896-97 in the previous decennium having been exceedingly bad. In Gudiyáttam and Kangundi taluks this seasonal improvement was not so strongly marked, and the increase during the decade is consequently nearer the normal for the Presidency. In Tirupattúr an outbreak of plague occurred just about the time of the census, and the cessation of increase, which the figures show, is probably the result of temporary evacuation.

70. Of Rámnád, the Collector observes that the prosperity of Sríviliputtúr, Aruppukkóttai, and Sáttúr has of late increased by leaps and bounds, largely owing to the increased cultivation of cotton. In Sríviliputtúr taluk there has been a considerable extension of irrigation under wells, and the fact that a tile factory has recently been established there may be taken as indicating increasing wealth, was much as it suggests a demand for a better class of dwelling-house.

71. The marked change in the fortunes of the Ambásamudram and Nángunéri taluks of the Tinnevely district is explained by the Collector as due to the abnormal figures obtained in 1891. In that year the paddy harvest of Ambásamudram, which attracts coolies from Nángunéri, was in full swing at the time of census, and subsequent fluctuations are due to the more normal situation encountered at the last two enumerations. The increase in Srívaikuntam taluk reflects the growing prosperity of Tuticorin and Srívaikuntam towns; although the most notable section of the latter's population, the Vellálas of Fort, Chapter XI shows to be on the verge of extinction. Tiruchendúr owed its large increase in 1901 to the occurrence at census time of an important religious festival; it is a poor taluk and bad seasons with consequent emigration have checked its rate of increase.

72. The increase of the Salem district during the period 1891-1901, the Collector considers to have been abnormal. In that decade the population of the district increased by more than 212 thousand souls; an increase of half this amount, the Collector observes, would have been more readily explicable. The set back which has occurred during the decade now under reference may be explained as due to plague, which continually afflicts the Hosúr taluk, and which by its marked occurrence in Salem town spreads panic in the Salem taluk. Uttangarai taluk is unhealthy, and from Krishnagiri there is said to be a considerable stream of emigration to Ceylon.

73. On the West Coast the settlements of Anjengo and Tangasseri have now been excluded from the Cochin taluk of Malabár. In the Wynaad, coffee planting fared poorly during the decade 1891-1901; in the succeeding ten years the opening up of tea cultivation has brought back prosperity. In Ernád, six rubber estates were opened in the decade; in Ponnáni, increase has been stimulated by an increasing demand for the products of the cocoanut.

74. In South Canara, Udipi and Coondapoor are said to have been comparatively free from the fever which checked their growth between 1891 and 1901. On the other hand dysentery is said to have prevailed in Kásaragod; whose cooly population have also become more migratory in their habits since the recent opening of railway communication with other parts of the district. Plague has visited Mangalore town at intervals since 1902, and in the taluk dysentery is said to have claimed nearly 10,000 victims in the last ten years. In 1894 the Amindivi

Islands suffered severely from cholera, and the results of the visitation are to be seen in the figures for 1901; better health, and increasing prosperity, duo to improvement in the price of cocoanut products, explain the improvement shown by 1911.

75. The Nilgiri district is somewhat abnormal, and population here varies largely in accordance with the state of the planting industry. Increase in the Ootacamund and Coonoor taluks is small as compared with that between 1891 and 1901, when planting thrrove, and numerous coolies from the plains were to be found on the hills. In Gúdalúr taluk there was a heavy fall in the population of 1901 compared with that of 1891, due no doubt to the failure of gold mining'companies in the neighbourhood, and to the abandonment of coffee estates. The increase of the last decade may be attributed to the large extension of tea planting which has taken place.

I.—Variation in relation to density since 1891.

(a) Up to 1904, the statistics in columns 2 to 6 are for areas of old districts.

(b) Statistics in columns 2 to 6 are for 1904 to 1910.

(c) Includes Sandúr.

(d) Includes Anjengo but excludes Laccadive Islands.

Note.—(1) The statistics in this table are adjusted for the areas of districts as they stood in 1901.

(2) The 'natural population' in column 7 represents those born and enumerated in the Presidency only.

III.—Variation by taluks or divisions classified according to density

(a) Actual variation.

Natural division.		Decade.	Variation in Taluks or Divisions with a population per square mile at commencement of decade of

CHAPTER III.—BIRTH-PLACE.

Of the 41,870,160 persons who constitute the population of the presidency all save 253,877 were born within its limits. The strangers within our British gates number 252,060, those in the Feudatory States 1,817.

2. Statistics already quoted in Chapter II show that the Madrasi is not unwilling to make a sufficient journey, such as that to Natal, the Straits Settlements, Burma or Ceylon, if at the end thereof he describes the possibility of solid pecuniary advantage. But that he is little addicted to wandering about within his own bounds becomes clear from an examination of the figures in Table XI, which show that, with the natural exception of Madras city, over 900 persons per thousand born in each district were there enumerated; the proportion ranging from 996 per 1,000 in South Canara to 932 per 1,000 in Nellore.

3. In one respect this table has proved unexpectedly satisfactory. The territorial redistribution of the Presidency about the time that the census was taken was calculated to cause considerable confusion in respect of district of birth; at census classes it proved a hard saying for the would-be enumerator that the birth of a citizen of Madanapalle, or of Srivilliputtūr, should be credited to districts which had not then attained actual existence. At the census of 1901 Banganapalle State apparently gave birth to but 12 of its 32,264 inhabitants; a return due to the fact that, for the dwellers in those parts, Kurnool district and Banganapalle are alike Kurnool, but distinguished as "Company's territory," and "Moghal territory."

4. The reasons for this disposition are really not far to seek. The majority of the inhabitants of the Presidency are of the small farmer, or agricultural-labourer classes, and such in every country are rooted fairly firmly in their native soil. To break their ties with home a definite and sufficient reason is needed, and in Micawber-like migration from one natural division to another such reason is not found. A parallel may be drawn from the case of Ireland, a country whose most marked characteristic is emigration. From Ireland there is a steady outflow to America, because America holds out a fairly certain prospect of better things. But migration within Ireland, from north to south, from east to west is, I should say, comparatively rare, inasmuch as there is no adequate reason for making the change. Similarly in Madras, the labourer is apt to go to Burma or Ceylon; but the small farmer is not in the least likely to better his condition by a move from Anantapur to Tinnevely; or the labourer by transferring himself from Trichinopoly to Ganjām. In fact so marked are the differences between the natural divisions of the Presidency, that such move would be equivalent to a speculative emigration of the Irish labourer to (say) Normandy; where prospect of remunerative employment is not appreciably greater than in his native land, and where differences of language, race, and climate, are obstacles sufficiently apparent to the dullest intellect. Add the enormous areas of the Madras natural divisions, the cost and imperfection of communications, and the rural Wilhelm Meister is seen justified in his conclusion that, if his America is not immediately at hand, it is at least nowhere else within the Presidency.

5. That the Madrasi may be of an even more stay-at-home nature than figures indicate, is suggested to me by remembrance of a curious fact, which I noticed on my preliminary tours of instruction in connection with the census. A native (say) of Malabar, who emigrates to Tanjore, and whose children are there born, will as a rule, unless corrected, return the birth place of such children as Malabar. The case is similar in regard to any other district; the explanation being that district of birth, especially if strongly differentiated by nature from district of residence, is regarded as conferring a certain "nationality," which the possessor is loth to abandon for himself or for his children.

6. Even in the case Madras city and Chingleput, where the ratio described in paragraph 2 falls to 856, and 913 per 1,000, respectively, migration is statistical rather than real. Of 58,000 persons born in Madras city but enumerated elsewhere, 20,000 were enumerated in Chingleput; a fact which in all probability implies no more than that they happened to live, or to be, on the night of enumeration outside the municipal boundary. A further 18,000 were found in the adjacent districts of North Arcot, Chittoor, South Arcot, and Nellore; Tanjore, Trichinopoly, and Madura, account for 7,000 more, of whom by far the greater part are found in the cities of those districts.

7. If Chingleput has borrowed from Madras, it has returned in larger measure. Of 126,204 emigrants from that district 69,576 are found in the city; while 11,835, 21,524, and 9,151, are respectively in the districts of Chittoor, North Arcot, and South Arcot, whose frontiers march with those of Chingleput.

8. Or, to sum up the matter in a few words, internal migration in the Presidency can be in almost every case explained by recognition of the arbitrary nature of district boundaries. The emigrants from Ganjám and Vizagapatam will, as a rule, be found on the other side of an imaginary line; for the balance the well-known influx of labourers from these districts into the Kistna Delta will account. Of 23,593 emigrants from Anantapur, 19,718 are found in Bellary, Cuddapah, and Kurnool; of 23,980 from Bellary, an appreciable number are found only in Anantapur, Kurnool, and the little state of Sandúr, which is actually in Bellary district.

9. From Indian provinces and states outside Madras immigration is inconsiderable, and has fallen from 245,916 in 1901 to 238,730 in 1911. As was the case ten years ago, so at present these visitors in our midst come mainly from the neighbouring states of Mysore and Hyderabad, and number 153,424, as against 151,816 in 1901. The Hyderabad immigrants are localised, as one might expect, in Kistna, Guntúr, Kurnool, Bellary, and the Gó dávari Agency, all districts touching the Nizam's frontier; those from Mysore territory are found on the other side of the frontier in Anantapur, Bellary, Coimbatore, Salem, North Arcot, the Nilgiris, Malabar and South Canara. Bombay immigrants, numbering 17,301 are found mainly in the trans-frontier districts of South Canara (2,700), and Bellary (5,831), while a considerable number (2,376) were enumerated in Madras city.

10. In regard to types of migration, *i.e.*, temporary and permanent, it is difficult to draw any conclusion from the census figures. A large preponderance of males suggests among the upper classes a temporary outgoing for purposes of business, with the ultimate prospect of return. Such may be the state of things among the Bombay immigrants to Madras city, or to Anantapur. Among the labouring classes the explanation does not hold good: the 66,613 Vizagapatam emigrants in Kistna are probably for the most part agricultural labourers, who will in due course make their way back; their equality of sex proportion (33,973 males, 32,640 females) is due to the fact that in their walk of life men and women work alike.

11. Sex disproportion among emigrants from Malabar is strongly marked (19,762 males, 10,610 females), and in the majority of cases can be explained by the reluctance of the Malabar woman to leave her home; a subject treated at some length in Thurston's "Castes and Tribes of Southern India." This sex disproportion is noticeable in every district except Rámnád, where the proportions are males 2,589, females 3,027. Search in the records afforded no explanation of this curious phenomenon. The immigrants are found mainly in the Sáttúr taluk, where too the sex disproportion is most clearly marked (males 784, females 1,337). In this taluk Malayálam speakers are comparatively few, and their sex proportion tallies with that generally found in the case of Malabar emigrants (males 298, females 72). Furthermore the "Malayálam caste" people found in Rámnád number only 526. It would therefore seem tolerably clear that these people, whatever they may be, are not genuine Malayális. The suggestion has been put forward that they may be Tamil speaking Travancoreans, and that enumerators failed to distinguish between Travancore and Malabar.

12. Migration across an imaginary frontier is probably permanent, and in most cases suggests that an individual has only moved a short space; if a man, to the neighbourhood of his lands or business, if a woman, to her husband's home. It is customary among Hindu women to return to their parent's home for their first confinement; consequently, if the locality of birth has been given accurately, there may be many persons actually born on one side of a dividing line whose permanent home is on the other.

13. The preponderance of women among the emigrants from Madras city confirms a suggestion made in the special report on the figures of the Presidency town, that for one reason or another women are leaving the city in increasing numbers.

I.—Immigration (actual figures 000's omitted).

CHAPTER IV.—RELIGION.

(1) HINDUISM.

ALTHOUGH instances have not been wanting at previous censuses of a misplaced zeal, which led a minor official to swell the number of his fellow believers by hasty inclusion of any dusky Gallo, or to seek a mild satisfaction in attributing to his enemy theological views tending parlously to damnation, we may safely assume that the average enumerator does not demand from his victims a reason for the faith that is in them, but courteously accepts their word for whatever profession they may choose to make.

2. The fact of the immense numerical preponderance of the Hindus over followers of other creeds is as patent at this census as at those precedent to it. Viewing the Presidency as a whole, the marginal figures show the distribution according to religious profession of 10,000 of its people. If we descend to the

Hindus	...	...	...	...	...	8,892
Muhammadans	...	...	...	...	...	660
Christians	...	...	...	...	...	289
Animists	...	...	...	...	...	153
Others	...	...	...	...	...	6

greater detail of natural divisions, we find that the index of Hinduism varies from 9,419 per 10,000 in the East Coast Central Division, to 6,808 in the Agencies, and 7,043 on the West Coast.

Of the districts which constitute these divisions, Vizagapatam* is pre-eminently Hindu, with 9,869 per 10,000 of its population professing adherence to that faith; while only in the Ganjam Agency, and the tiny enclave of Anjengo, where Animists and Christians respectively predominate, are Hindus in a minority.

3. Still acceptance of a fact need not preclude search for its explanation, nor need such search involve the dangers apparently attendant on the questioning of the fact.

4. It is well to remember that the strict connotation of the word Hinduism is racial and social rather than theological. European convention has applied the general term to the theology of those Indians who do not profess adherence to some other definitely named faith, or an absolute denial of all religious faiths. Thus alone the term "Hindu" figures so largely in column 4 of our census schedules; for the ordinary Indian, when asked for his faith, is wont to specify his sect (Vaishnavite, Saivite, Smárta, etc.), or possibly his caste—answers which the enumerator as a rule, though not invariably, subsumes under the general head Hindu.

5. To this aspect allusion has already been made in Chapter II, where were mentioned the possibilities of increase among Hindus, other than natural. On such other increase a chapter on the religion of Hinduism should be silent, for Hinduism, in its present acceptance at any rate, is non-proselytizing.

6. At the same time we may admit that Hinduism is in a sense acquisitive. If it strains at the individual gnat it can swallow with cheerfulness the tribal camel: some slight profession of faith, and moderate proficiency in the nice conduct of ceremony are sufficient to secure for an aspiring Animistic tribe (gods included) admission within the pale.

7. But this facile, though oft given, explanation does scant justice to its great subject. If Hinduism accepts the nominal adherence of unlettered masses, it shows itself no less potent to retain a devotion which many of the most able of Southern India will scarcely pay to an empty name.

* Here we see a foreshadowing of a difficulty to which frequent allusion will be made. Vizagapatam is in close touch with a large hill tract, where, statistics notwithstanding, "Animism" is as good a label for the faith of the inhabitants as "Hinduism."

8. For the believer, the truth of his belief affords an adequate explanation of its widespread acceptance. To the non-Hindu, it may well occur that Hinduism owes much of its success to the fact that it is in its essentials but a pure system of metaphysical doctrine, to which a man may give assent, without the obligation, expressed or implied in less philosophical religions, to mould his life on particular lines; and at the same time is a system peculiarly in harmony with the material environment of the minds to which it is presented.

9. Ethical considerations apart, mankind has always sought in his religion an explanation of the primal mysteries of his being: whence he came, his relation to the place wherein he finds himself, his ultimate destination. Judaism, Christianity, Muhammadanism have for their adherents cut the Gordian knot of perplexity with the sword of revelation. To their believers they offer a solution of these difficulties eminently comprehensible and satisfying: abandoning the search for unity, they present the readily intelligible duality of God and his creation

10. More subtly philosophic than their western neighbours, Hindu thinkers have recognized the difficulties underlying the theory that something could be created out of nothing, that part of this something should return to its original nothingness, while part should possess inherently a patent of immortality. Man—this latter part—forms, as is only to be expected, the most emergent study of the human philosopher, who, viewing the matter without prejudice, must find it inexplicable that man prospectively immortal, should not be retrospectively so. Absolute mortality (annihilation) is rendered improbable by the fact of man's being here at all: for if he can come into one existence, there is nothing inherently improbable in the theory that he can pass into another. If he is in one, and can pass into another, surely he must come from yet a third.

11. To these questionings Hinduism appears to offer a ready answer by its doctrine of re-incarnation, to which all Hindus render at least an unthinking allegiance. Yet, to the sceptic, this doctrine would seem to be rather the allegorical representation of a truth, than an objective truth in itself. For in the popular doctrine of re-incarnation is not involved that of the persistence of a conscious personality; and on strict examination it seems incredible that a man should profess the belief that formerly he was somebody else, and is to be yet a third person in the future. It needs a hard struggle to disentangle our present personality from the present phenomena of our life; we find it impossible to think the phenomena of a life past, present, or to come, without thinking into it our present personality, whatever that may be.

12. For one school of thinkers among Southern Hindus a way remained. Abandoning the theory of personality in the life antecedent and that to come, Sankara and his followers reached a certain logical consistency by the practical abnegation of personality in the present.

13. Assumption of some kind must needs be made. By this abnegation, man, and the universe surrounding him, which indeed may have no existence *apart* from him, are but the manifestation in multiplicity of the divine unity, which neither begins nor ends. Man and all other temporal manifestations that surround him pass away; man does not pass into other forms, but the divine unity continues to manifest itself in multiplicity. Thus in a sense, as a particular being, man suffers annihilation; in another sense, he is immortal; inasmuch as that which constitutes him, in virtue of its self-manifestation in him, has been from all eternity, and can never cease to be.

14. It is questionable whether this doctrine would be possible in a land whose physical circumstances tend to force the sense of personality on mankind. In harsh climates man must bestir himself to live; if he dies he suffers in the process the inconveniences of cold and hunger. He finds it hard to make a living, and the experience of hard work tends to make him work all the harder. In Southern India a living is easily got, food is cheap, clothing more or less unnecessary. Vitality is not great, death is not a rending process so much as a gentle fading

away. In the chiefest glory of the southern teachers we can trace climatic influence ; if the practically bloodless propaganda of Sankara, Rámánuja, and Madhva, never
 Made accurst the name of man, and thrice accursed,

The name of God,

still these three apostles scarcely possessed the fiery zeal, that won the hearts of men to Paul, Muhammad, Loyola or Wesley.

15. Widely as spread the monism of Sankara, the notion of personality died hard, in fact refused to die. Sankara gave no satisfactory reason for the divine unity choosing to manifest itself in the phenomenal world. "It must be a very ill-advised God" said Schopenhauer, himself in no better case with his theory of the phenomenal universe as the objectification of the will to live, "who knows no better way of diverting himself, than by turning into such a world as ours." Emergence of the phenomenal world through *Māya* (illusion) is but a verbal solution of the difficulty : seriously considered it raises *Māya* to a rank equal to that of divinity itself, or superior, because limitative. Thus the monists were driven to explain *Māya*, not as a power independent of God, but simply as the eternal power, or will, of God to differentiate himself, manifested as that which renders human experience possible ; but the question will still remain whether this power forms an integral part of the divine nature, and therefore demands expression ; in which case the absolute freedom of the divine would appear to be curtailed ; or whether the exercise of such power is optional, and the divine thus ill-advised in his exercise, as *apud* Schopenhauer.

16. Furthermore, applied to human conduct, considered merely in the human aspect, such philosophy is unlikely to produce any beneficent result, if indeed it is so applicable at all. The individual can in the last resort do neither good nor harm to the world, which, as a manifestation of the divine unity, is independent of him, even while including him as part of its manifestation ; he cannot influence himself, for he as individual is nothing. Man's only incentive to virtue can be the perception that it is good to be good ; diverting his gaze from the possibility of result to his actions, he must attain to a greater knowledge of his unity with all things, and allow his actions to proceed solely from the degree of his knowledge. But for practical purposes we must admit that, while man, as we know him, may render his assent to the unity of all things as a possible speculation in philosophy, the probability of his digestion of such knowledge, to the extent that it will inform his conduct as a transient phenomenon, is small indeed.

17. Thus revived old dualistic faiths in the qualified dualism of Rámánuja, which distinguished man in, though not from, God ; and in the more positive doctrine of Madhva, who made the severance complete.

18. But to Hinduism so described objection may as well be taken, as being but Bráhmaism pure and simple, or, more properly, a religion of the learned, neither accepted among, nor comprehended by, the majority of those, to whom in Southern India the term Hindu is applied. Of the learned no table affords us the tale and measure, but the Bráhmans, table XIII shows to number but 313 per 10,000 of the total population, and 352 of a similar number returned as Hindu : proportions far exceeded by the 565 and 635 per 10,000 of the Tamil Paraiyans alone, to whose simple souls these metaphysical aridities offer scant attraction.

19. Yet for this reason to deny at once a place in the ranks of present day Hinduism to the manifold worshippers of multifarious godlings, is no more just than it would be to question the Christianity of the Irish peasant, whose theological attention is concentrated mainly on the

"Life, death, and miracles, of Saint Somebody"

or that of his Latin confrère, who renders allegiance to

"Saint Somebody else, his miracles, life, and death."

Nor indeed in the Southern Presidency does the denial of "Hinduism" even to the lowest and most illiterate find many advocates.

20. There are, it is true, sundry mechanic criteria, in virtue of which it has, at times, been sought to determine the admissibility of classing as Hindus certain

sections of the population. Of such the following questions supply an illustration. Do the persons concerned (*a*) worship the great Hindu Gods; (*b*) enjoy the right of entrance to Hindu temples and shrines; (*c*) receive the ministrations of Bráhmán priests; (*d*) possess sufficient worthiness to give water to caste Hindus; (*e*) cause pollution by touch or proximity?

21. A means of judgment is thus at first glance provided; but closer consideration will show the necessarily superficial character of a judgment resting on such foundations.

22. The most debatable Hindu may very well worship, and often does worship, the great Hindu deities.* Such worship is no necessary impediment to a simultaneous adoration of many minor godlings: the two acts of faith, as will afterwards be observed, at times co-exist even in the Bráhmans. Again, right of entrance to a temple or shrine is in no wise an essential of Hinduism. Such right is not conceded to the Shánán, who claims to be a Kshatriya, and whose Hinduism no one disputes: nor in certain cases will it be allowed to the Bráhmán, as such, should he lack the ordinations or consecrations requisite for the practical, or better, ritualistic observances of religion.

23. As regards acceptance of Bráhmanical ministrations, there are many undoubted Hindus, who, in theory at least, reject the sacerdotal authority of the Bráhmans. Among such may be mentioned the Lingáyats, now rather a caste than a sect comprising many castes; and the goldsmiths, who claim a Bráhmanhood of their own. Indeed the feebleness of this criterion may well be illustrated by its application to Christianity: although the ordinary British non-conformist neither asks nor receives the religious attentions of a Catholic priest, neither party is likely to dispute the Christianity of the other.

24. Similarly may these other tests be tried and found wanting. A Bráhmán does not, it is true, receive water from the hands of a Paraiyan; but neither will he drink from the hands of a Súdra. Súdra again does not invariably drink with Súdra, nor Bráhmán with Bráhmán. Pollution caused by touch or proximity has been publicly rejected, in theory, as an essential of religion by sundry eminent Hindus; in fact, by many more, not less pious if less vocal, in the daily practice of the railway.

25. On the details of this aspect of Hinduism I have nothing new to say. The spirits, godlings, or devils, invoked throughout the Presidency, and the method of their adoration, have been described in Bishop Caldwell's "*Demonolatry in Southern India*;" in Mr. (now Sir Harold) Stuart's census report of 1891; by the present Bishop of Madras in his "*Village Deities of Southern India*;" in Mr. Thurston's "*Castes and Tribes*," and in the Gazetteers of the several districts. The inter-relation of castes in the matter of priesthood can likewise be studied in Mr. Thurston's work, and in the "Caste glossary" appended to the census report of 1901.

26. Whatever be their present day union or interminglement, it is difficult to imagine any original connection of the Áryan Bráhmans, and their subtle philosophies, with the gross demonolatry of the Dravidian peoples who surrounded them. Philosophic Hinduism or Bráhmanism, it has already been suggested, is rather the attempt to find an answer, without the aid of a final revelation, to an enigma probably insoluble, than a religion in the sense understood in modern days. Holding certain philosophical opinions, which they neither expected nor particularly desired their Dravidian neighbours to share, it is unlikely that the early Áryan theists made any serious efforts to obtain adherents to their way of thinking. But satisfied with the acknowledgment of their undoubted intellectual superiority, they built gradually many a connecting bridge, between their own somewhat unpractical speculations, and the extremely material demonologies of the Dravidians.

* At Chingleput Railway Station I conversed on religion with a man, who informed me that he was a Vaishnavite Paraiyan. It is not probable that by these words he expressed a philosophic acceptance of Rámánuja's dualism, but rather that he deemed himself a worshipper of one member of the Hindu Trinity, although his actual worship could not be performed within a Hindu shrine.

27. In virtue of these accommodations a certain community of faith exists to-day between most so-called Hindus. The Hindu of the villages and fields worships as God the great philosophic triad, much as does the unlettered Christian worshipper, whose adoration is seldom consciously devoted to any particular member of his Trinity. If X, Y and Z, objective and often highly objectionable devils, still engage a large portion of the peasant's spiritual attention, he has about him a certain atmosphere of more subtle religious ideas: prayers, hymns, which he knows by rote, and of which he comprehends the purport, although he may not understand the language. To a certain extent his *grāma dévatās*, or propitiable demons, are the saints of the West, confidential intermediaries, to whom his prayers may be sent for transmission, and to whom his every day necessities may be expounded.

28. On his side the Bráhmaṇ has undoubtedly clothed many of his abstractions in most earthly guise. For his every day external affairs a certain regard to demonic susceptibilities does at least no harm; for the due ordering of his household he has attached the sanction of religion to methods of clothing, shaving, and other natural exercises.

29. What then is the conclusion of the matter, or the present day effects of the religion known as Hinduism, among those who return it as their faith? Just as every nation is said to get the government that it deserves, so perhaps divinity manifests itself to various races in the way most suited for their acceptance; and underlying every religion are some main ideas, ultimately identical for those who care to look nearer than the external trappings. "Whosoever comes to me, through whatsoever form I reach him, all men are struggling through paths which in the end lead to me."

30. Admitting that the Bráhmaṇ came as the apostle of a higher and more spiritual faith to a people, of whom many are still in the earliest stages of Animism or anthropomorphic religion, it is hardly just to assume that his present assertion of divinely inherent superiority is the result of consistently selfish design for his own temporal aggrandizement. Probably he followed quite as much as he led the course of events; it was well that he did not level down, and in all probability it was well nigh impossible for him to level up. Had society been fit for the equality and fraternity of the Buddhists, the Bráhmaṇ could scarce have withstood a movement with such inherent claims to general acceptance.

(2) MUHAMMADANISM.

31. In contrast to the subtle theologies and metaphysics of Hinduism, the Muhammadan creed certainly possesses the merit of simplicity. "*There is no God but God: Muhammad is the messenger of God*" is a formula easily comprehensible, and in its way well nigh all embracing. To those who demur to acceptance of its second article, it may be pointed out that the prophet himself did not declare this tenet as in any way necessary to salvation; while, if the matter be viewed dispassionately and without prejudice, it is but a logical, so far as human logic goes, corollary of the essential statement. Grant the existence of one true God, and one alone, and it becomes difficult to assert that the man, who preached this faith with acceptance to the idolaters of Arabia, and whose word "has been the life guidance now of a hundred and eighty millions of men these twelve hundred years," was *not* God's messenger.

32. It may be the natural perversity of mankind that has introduced schism and difference of interpretation into every faith originally claiming to be but the simple exposition of universal truth; or it may equally well be that a religion too implicitly accepted, and without the vitalising influences of doubt and free discussion, would itself expire of sheer inanition. Muhammadanism has been no exception to the general lot, but considerations of practical convenience forbade the recording of Muhammadan sects at the present census. Taking first the great division into Sunnis and Shíahs, the request of the Shíahs for separate enumeration has not been complied with since 1881, owing to the then ascertained paucity of their

numbers in Madras. It is however an interesting fact that the only ruling Muhammadan Chief of Southern India, the Nawab of Banganapalle, is a Shiah. Equally has been disregarded the division of the Sunnis into the schools following the four Imams; Noman, better known as Imam Abu Hanifa, or Imam Anzam; Muhammad, son of Idris, known as Imam-Shafai; Malik, son of Anas; and Ahmad, called Imam-i-Hanbal. The followers of the third and fourth of these teachers are rarely found in Southern India, possibly because the tenets of their school are rigid, and not too easy of acquisition; and though, as pointed out by Mr. Quadir Hussain Khan in his "South Indian Mussalmans," the distinction of Hanafi and Shafi, if ascertained, will at times afford a valuable clue to *racial* divergence among Muhammadans, detailed enquiry in this direction is of little use, inasmuch as the majority of Southern Moslems, although not for the considered reasons of the "Ghir Mukullid" school, are indifferent to or ignorant of these distinctions.

33. An attempt was made by means of enquiry throughout the several districts to ascertain the respective proportions of (a) pure-blooded Muhammadans, and (b) recent converts to that religion. The distinction, as pointed out by several correspondents, is technically incorrect, inasmuch as "race" and "religion" are not convertible terms; but in default of a better it is at least comprehensible.

34. Although, as might be expected, no very definite information could be obtained, most of those consulted were of opinion that the majority of Southern Muhammadans were, at one time or other, though possibly at a time very far remote from the present, adherents of some form of Hinduism. It may be possible to gauge the completeness of their absorption into Islam by a comparison of the Muhammadan population with the number of those returning Hindóstáni as their customary vehicle of speech. For, while the number of those, other than Muhammadans, habitually using this tongue in this Presidency is undoubtedly very small, its fluent use is regarded among Muhammadans as an indication of social and even religious status, the Urdu-speaking Muhammadan being wont to adopt a somewhat Bráhmancial attitude towards the Dravidian fellow believer, who still clings to his old vernacular.

35. Excluding from our calculations 1,032,757 Máppillas, whose almost universal ignorance of Urdu strikes the visitor as curious,* we are left with 1,731,710 Muhammadans; 848,061 males and 883,649 females. The Hindóstáni speaking population numbers 975,064 (table X), of whom 498,077 are men, and 476,987 women. We have thus a surplus of 349,984 Muhammadan men, and 406,662 women, over the Urdu speakers of either sex. Of this total we may look for the greater portion among the 220,999 men, and 252,316 women, of the Labbai and Dúdékula communities; the former being as a rule Tamil converts, the latter, Telugu speakers of very doubtful adherence to any creed. The balance is probably to be found among the Sheiks, whose fellowship perforce receives most new believers.

36. The conclusion thus attained would seem to be that some 56 per cent. of non-Máppilla Muhammadans, either came to this country imbued with their faith, or else received it so far back that the newness of conversion has now passed from them. It is however possible that the return of Hindóstáni speakers is somewhat greater than the reality; partly because of the converts' social desire for complete assimilation with his fellow believers, partly owing to a curious idea, noted by one correspondent as prevailing among the lower classes, that admitted proficiency in, and habitual use of, a "profane language" is apt to make one stand in peril of the judgment.

37. As may be seen from subsidiary table II, it is only in the West Coast division, and in a lesser degree in the Deccan, that the followers of Islam constitute an appreciable percentage of the population. In the total population of the Presidency they number, as already noted, but 660 per 10,000, as against the 8,892 of the Hindus. In the districts they loom largest in Malabar, home of the Máppillas,

* At the same time as noted in Chapter Xi they are of good Muhammadan descent on one side at least, while their present zeal is unquestioned.

and in South Canara, where the same sect by far predominates; in the little states of Banganapalle, and Sandúr, and the Deccan territories of Cuddapah, Kurnool, and Bellary.

38. Their rate of increase (11 per cent.), greater than that of the general population and of the Hindu community, may be attributed, in part to their more virile nature and habit of life—a doubtful point treated more fully in Chapter II—in part to the fact that Islam, unlike Hinduism, recognizes, in theory at least, the duty or desirability of proselytism. This latter supposition is strengthened by observation of an increase of 14 per cent. among the Máppilla community, who number some 37 per cent. of the total Muhammadan population, and among whom is found a more living interest in the faith than elsewhere in Southern India. Theirs is the well-known theological college of Ponnáni,* where too is found an association (Mounnath-ul-Islam Sabha), which gives religious instruction gratuitously to converts, and renders material assistance to those under instruction.

39. But if, elsewhere systematic proselytism, as most of my informants report, has now become a thing of the past, such progress, apart from natural increase, as the faith may make, must be due to its inherent attractions, or to the accommodations which it is ready to make with existing circumstances. Although the recorded exploits of Tipu and Hyder, and the silent witness afforded by the conversion of Hindu shrines to mosques, as at Penukonda where Baba Fakruddin's *miswak* blossomed and still grows, suggest that the hand of Islam was once laid heavily on Southern India, it need hardly be said that the era of forcible conversion has long since passed away.†

40. Spiritual wrestlings being out of place in a census report, it were well not to criticise the theoretical superiority or inferiority of rival faiths. But, whether from design, or from the insensible influence of environment, there can be no doubt that certain compromises now exist in Madras between Muhammadanism and Hinduism. Propitiation of disease-godlings, worship of patron saints and local deities, veneration of relics, practisings of the black art, divinations of the future, Hindu ceremonies at birth and marriage (though not as a rule at death; all practices satirized by the poet Hali‡ abound throughout the Presidency, and render the stern simplicity of Islam more attractive for its rural followers.

41. A particular example of such compromise may for purposes of illustration be noted in the case of the Dúdékulas—a community numbering 71,612 souls, of whom

* Ponnáni is moreover the residence of a character somewhat unique in the 20th century, a saint, of whom I have received the following curious account:—

“He is called Parihaviliya Thangal, and is more than 80 years old. He seldom or never washes his person or his scanty raiment, fasts much, speaks rarely, and sees few people. He is much revered by Rowthars and Máppillas. Offerings are made for him in many mosques of Malabar, and cocoanut shells are deposited for him on the road side under trees all over South Malabar, to await collection by his agent three or four times a year. These shells are regarded as tabu by all classes of the population, and though there is nothing to prevent any one from collecting and selling them, the Thangal rarely has to complain of loss. He has a great reputation as a healer of the sick. The method employed is to tap the sick person lightly with a stick; unlike Christian scientists he does not operate from a distance. Unlike most modern saints he has no itch for money, and the cocoanut shell offerings (worth about Rs. 1,000 a year) are appropriated by the members of his family for the maintenance of the Saint and themselves.”

† Mr. Muhammad Karimulla Faruki, to whom I am indebted for an admirable note on South Indian Muhammadanism, gives me the following curious instance of Time's revenges. At Conjeeveram he discovered a stone much venerated by Hindus as possessing the power of relieving pains and other ailments. On digging up and cleaning this stone, he discovered thereon an inscription commemorating destruction of some Hindu shrine by an emissary of Aurangzeb, and the devotion of its revenues to Moslem charity! On a mosque near a Hindu temple the same enquirer found a Persian inscription, commemorating the pulling down of a temple and the erection of a mosque in its place. *Per contra*, he instances the aid lent to the Bráhmans of Conjeeveram about 1714 A.D., by sandy Muhammadan notables, in recovering the image of Vishnu from Udayárpáráiyam, whither it had been removed in 1689 on removal of a Muhammadan ferry.

‡ If a stranger (other than a Muslim) worships an idol he is (denounced as) a heretic.

He that says that God has a son is a heretic.

He that worships fire is a heretic.

He that attributes miracles to stars is a heretic.

But the Moslems (God! bless them) have a wide field.

They can worship with impunity anything they like.

If they like they can make a prophet God.

Exalt Imams to the rank of the prophet.

Make offerings over graves day and night.

Invoke the blessings of the Martyrs.

The Unity does not suffer by these acts.

Religion is not disturbed, nor do the essentials of the faith disappear.

the majority are found in Cuddapah, Kurnool, and Anantapur. Of them, an educated Muhammadan doubts "if they ever think of such a thing as salvation." They worship their tools on Bakrid day, as do Hindus on occasion of the Dusserah; they adopt both Hindu and Muhammadan names; they do not go to mosque, or pray according to the rites of Islam, but offer promiscuous vows to Hindu godlings and Muhammadan saints. Even in their chiefest orthodoxy, the performance of Fatheha on the occasion of a death, there are certain quaintnesses. If such be not performed, the soul of the deceased is apt to become an evil spirit; while, as it undoubtedly partakes of the funeral bakemeats, the lid of the cooking vessel is kept half open during the ceremony, to save the spirit the trouble of opening it. The dreadful contingency of a Mullah not being at hand on occasion of need (the Dúdékula himself has no store of Korán verses) is thus guarded against. A bamboo tube is washed, when the Mullah is requested to repeat half a dozen Fathehas into it. The tube, thus filled with sacred breath, is stoppered with clean rags, and secured to the roof with a well washed rope. When occasion arises, the man of the house takes down and unstoppers the tube, which he passes over the cooking vessels, the while repeating the name of the deceased. Careful not to exhaust more than one of the Mullah's repetitions he closes the tube, and puts it by till occasion next calls.

42. Similarly a knife for the slaughter of sheep or fowls can be sanctified by a Mullah for a Dúdékula ignorant of the article of cutting.

43. Nagore, seven pilgrimages to which are said to equal one to Mecca, strikes the visitor as more Hindu than Muhammadan. Hinduism and Muhammadanism have here so far amalgamated that "the Hindus assist the Muhammadans in carrying their God Allah in procession"—a startling statement by one of my correspondents.

44. Moreover even beyond the broad distinctions which race, occupation, and education are wont to draw 'twixt the followers of every religion, there may be found certain traces of the Hindu "caste" idea existing among Muhammadans in Madras. Here a Muhammadan, although he may not acknowledge the eminence of a Bráhmaṇ, yet very frequently reflects his Hindu environment so far as to show a quite Bráhmaṇical dislike for the Pariah. The train of thought thus started may persist in his attitude towards divers members of his own community.

45. Some curious reports of sections considered "low" have reached me from various districts. At Kilakkarai and Periyapatnam in Rámnád lives a strange community busied with diving for shells, and one from which other Muhammadans keep aloof. Of a similarly circumstanced body I hear in the Nannilam taluk of Tanjore. In Kistna, the Muhammadans who follow the professions of barber, butcher or skin dealer, appear to accept among themselves the Hindu estimation of these arts. The contemptuous name (referred to in Chapter XI), bestowed by arcients of the church on new made Sheiks, scarcely suggests that all are, *primâ facie* at least, equal in the eyes of the true believer.

46. In certain communities apparently homogeneous, such as Dúdékulas and Rávuttans, we find the characteristic Hindu formation of endogamous sub-sects, territorial and occupational. Family endogamy is a Muhammadan characteristic, which, if the family be or become sufficiently large, is apt to lead to formation of a small endogamous caste.

47. But a detailed study of Hindu influences on Muhammadanism is beyond the scope of this report. Both creeds go far outside what is considered the province of religion in other countries, in the minute regulation of social and personal details of conduct: a certain resemblance in such regulation is less surprising than would be absolute difference.

48. Just as too much is habitually made of the backwardness of Muhammadans as a class, so ascription to their creed of responsibility for such backwardness as may

be, is certainly unjust. Knowledge of a foreign tongue (English)*, addiction to the clerical profession, success in passing examinations; when all is said and done, these are somewhat artificial criteria of the progress of a people. If less receptive and industrious than the Hindu in acquiring a knowledge of rule and sanctioned usage, the Muhammadan is not infrequently the readier of the two to handle a situation, which has to create not follow a precedent. That his creed is not *per se* antagonistic to the light its earlier and purer history shows. †

49. Yet the need of constructive reform within the faith to-day in Southern India few of its most ardent admirers will deny. The progress of modern thought and liberalism has abated the old priestly governance; but as yet little replacement has been attempted. Whereas a moslem friend tells me that in his youth he saw two Muhammadans publicly flogged by order of the *Jamaat* for immorality and drunkenness, that in those days the Patel commanded more influence than any modern official; to-day another writes that *Jamaats* are dead, mosques are not looked after, Muhammadan endowments are abused, the people are either ignorant of their religious duties, or else slothfully indifferent to their performance. The need is for some Socratic gadfly to sting the lazy into action, some modern Ezekiel to see new life breathed into dry bones—*Exoriatur aliquis*.

(3) CHRISTIANITY.

50. Some seventy-four years ago, a celebrated philosopher, writing on the subject of religion, spoke of "300 bribed souls," "notable for immorality," as representing the result of Christian missionary enterprise in India. Even granting that the philosopher's ignorance of India was on a par with that of most intelligent dwellers in Europe, it is interesting to contrast with the assertions of the past the facts of to-day, when the Christians of the Southern Presidency alone number 1,208,515, or 289 per 10,000 of its total population.

51. Excluding 40,928 European and Anglo-Indian Christians, whose faith may be described as ready made, and whose most interesting feature is that atheism or agnosticism on their part is considered equivalent to acceptance of some form of Christianity, we find that Indian Christians have increased during the decade by 168,964 or 17 per cent.—a rate more than double that of the increase in the total population, and one which compares favourably with an increase of 8 per cent. among Hindus, and 11 per cent. among Muhammadans.

52. Granting that a marked increase of adherents is but what one might naturally expect in the case of a religion actually and avowedly proselytizing, it may be well to consider what attraction such faith can offer to those whose allegiance it desires to win.

53. There has been at all times a tendency to attribute the progress of Christianity in India to the material advantages associated with conversion. Applied to the case of converts of good position, on whom conversion frequently entails material loss and social inconvenience, the statement is absurd: in respect of the out-castes of Hinduism such criticism has a certain foundation, but, if rightly considered, is not one at which the Christian church need feel alarm. It is no more sensible to attribute the conversion of an unlettered Paraiyan solely to a reasoned preference for Christianity as a speculative doctrine, than it is just to attribute the continuance in Hinduism of the keen witted Bráhmaṇ to an admixture of selfishness and ignorance. Nowadays many missionaries are emphatically, and with justice, of opinion, that adoption of Christianity brings with it material benefit,‡ under ordinary circumstances not an unnatural consequence or concomitant, of moral and intellectual improvement, to certain classes from which converts are obtained.

* It may be seen from Chapter VIII that in proportion to their numbers the Muhammadans are but little behind their Hindu fellow countrymen in this respect.

† Such as the history of the Moors in Spain.

‡ Some candid souls among them have written to me that K.D.'s occasionally adopt Christianity in the hope of escaping police surveillance.

54. The hope of a decent life on earth is not any more, or any less, a bribe than the hope of a blissful eternity hereafter. To apologize for the conferring of such material benefits as naturally and inevitably arise from education, and especially, in India, from female education, self-respect, and escape from social thralldom, is the merest nonsense. It is neither good Christianity, nor good sense, to offer the Paraiyan the arid stone of theological speculation, while he lacks the bread of humanity. That the Paraiyan should desire to escape from the social slough, to which Hinduism has consigned him, is perfectly just and laudable; it is natural that he should look for, and fortunate that he should find in the missionary, some one who has the power and the will to assist him to the accomplishment of his desire. Absolute famine very probably does give the final impetus in many cases; the conversions of 1878 in the Nellore district were doubtless thus influenced, but are in no way discredited by the probable reasoning of the converts that, once received into the Church, they would be kept alive by the Church's best endeavour.

55. It has been assumed in the preceding paragraphs, and the assumption is corroborated by the testimony of sundry missionaries, that Christianity finds its new adherents chiefly amongst the outcastes of Hinduism. *A priori* the assumption is reasonable: a religion which teaches that all men are equal before God in merit, or lack of merit, is hard of acceptance for a man who holds as his fundamental tenet that all men are not equal, and that he himself is at the top, or near the top, of the ladder of merit. It is far easier to make Subbigadu believe that he is as good as Periyasami Aiyangar, than it is to convince Periyasami Aiyangar that he is no better than Subbigadu. Between Muhammadanism and Christianity in India, the resemblance is, in many practical, and even theoretical, respects too great to render probable any considerable transfer of allegiance from one faith to the other.

56. It is probably incorrect to imagine that Hindus, still less Muhammadans, of the better and more educated classes, are actuated by any fanatical spirit of opposition in their relation to Christianity. In general it is scarcely to be denied that the cosmopolitan apostles of modern Hinduism have borrowed, or at least derived a quickened interest in, ideas of social service, and of a faith concerned as much with the welfare of one's neighbour as the salvation of one's solitary soul, from study of the Christian writings, and from the precept and example of Christian teachers. In particular I have myself seen Bráhmans attend Christian services; I know of a Bráhman who presided at a missionary meeting; and various missionaries have informed me of material assistance in the shape of money, grain, and cattle, received from orthodox Hindus and Muhammadans. The question of caste apart, such opposition as the new-made convert has to encounter, springs often from economic rather than theological reasons. Under the Hindu system the "untouchable" occupies in the villages the position of a serf, and one of the immediate effects of conversion is the commencement of deliverance from his bondage. Thus from orthodox Malabar an Indian clergyman quaintly states as the advantages of conversion, "that the convert becomes fully entitled to the eternal peace of Heaven and has not to leave the road at the approach of a Bráhman." In Nellore several of the erstwhile serfs appeared at a recent show in the rôle of successful exhibitors of prize cattle. Entirely commendable as is this uprising, its immediate effects on village economy are disconcerting, and it is simply in accordance with human nature that some active opposition should manifest itself. The Panchama convert is reminded sharply of the debts that he or his ancestors have contracted to the village magnates; he finds it difficult if not impossible to obtain land on darkhast; water difficulties crop up; occasionally that fine old Indian war-horse, the false case, snorting takes the field. But the general testimony is that in time things adjust themselves; and that in his spiritual adviser the convert does not lack a temporal defender.

57. Turning to subsidiary table II, we find that the natural divisions range in point of Christianity, from the East Coast South, with 494 per 10,000 of its inhabitants Christian, to that of the Agencies, where, although proportional increase is greatest in later years, but 84 persons in 10,000 have as yet been gained over by

missionary endeavour. Excluding, as in some respects abnormal, the Nilgiri district, and those of Anjengo and Madrás, one recognizes with a certain sense of historical fitness the pre-eminence of Tinnevely and Rámnád (1st and 4th); in which districts, if we disregard the recent severance of the latter from Madura, the progress of Christianity will be for ever associated with the immortal names of Francis Xavier, Robert di Nobili, and Jean de Britto. Next to Tinnevely comes South Canara, home of an old Christianity almost exclusively Roman Catholic, whose early struggles and dissensions have been set forth by Father Francisco Xavier de Santa Anna.*

58. Guntúr, third on the list with 729 per 10,000 of its population Christian, and an Indian Christian community numbering 123,486 souls, represents in the main the later activities of Baptist and Lutheran Missions, whose adherents number respectively 60,766, and 43,610. At a decent interval, follow Rámnád (Roman Catholic), Kurnool (Baptist and Anglican), Trichinopoly and Tanjore (Roman Catholic) in close order, with Christianities varying from 462 to 380 per 10,000 of their total populations. The lowly position of South Arcot (11th) may cause some surprise when it is remembered as the home of Monseigneur Bonnand, one of the finest minds of later day missionary enterprise.

59. "He," said his successor, Archbishop Laouenan, "launched India into the Catholic movement." The chronicler of the French "Foreign Missionary Society" thus describes him: "He was not a man of strikingly brilliant intellect, but he was methodical and industrious to a degree, and his powers of work were extraordinary. With unflagging enthusiasm he combined a perfect balance and candour of judgment, and that uncommon gift, *common-sense*." His powers of organization, and that keen insight into human nature, which enabled him with equal effect to offer the kindest encouragement, as to the weary Father Fricand, or administer the sternest reproof, as to Father Mehay on the occasion of his adventure into the horse trade, can be appreciated in the history of his episcopate, which lasted from 1833 to 1861. He died at Benares when engaged in an apostolic visitation of all India. For the outside world his fame has been somewhat overshadowed by that of his remarkable, though not entirely agreeable predecessor, Father Jean Antoine Dubois.

60. But his great influence was not confined to any one district; it can be seen in the general progress of his church in the Southern (Tamil) country. In view of the comparative ill success of the Roman Catholic church among the Telugu people, deplored by the writer of a recent "History of the Telugu Christians," it is interesting to speculate as to what might have been, had not the choice of Mauseigneur d'Hèbert in 1833 called Father Bonnand from this people to the episcopacy at Pondicherry.

61. Thus far Christianity in general. With the uncomfortable reflection that he were well encased in triple brass, who, in a census report, would essay an estimate of the varying degrees of spiritual attraction or merit inherent in the creeds of the several Christian Churches, we may proceed to some consideration of the figures shown in subsidiary table V.

62. Calculations based on the total figures of 1901 and 1911 show the distribution of 1,000 Indian Christians. The suggestion of these figures is that Protestantism is gaining ground on its older rival, that the Syrian church is progressing rapidly, and that disappearance of "indefinite beliefs" indicates an improving accuracy of enumeration. But in their acceptance a certain caution is necessary. The increase in Syrian Christians is confined to one district (Malabar), where progress during the decade from 1,193 to 21,016 is obviously incredible. Suspicion becomes practical certainty, when we note that, in the same

	1911.	1901.
Roman Catholics	579	627

Indefinite beliefs	...	4

* Old Portuguese manuscript records in the possession of Father Cochet of Virarájendrapet, Coorg, translated for me by Father Anacleto, Principal of St. Bede's College, Madras.

district, Roman Catholics have decreased during the decade by an almost equally large number (16,000). The irresistible conclusion is, either that in 1901 some 16,000 Romo-Syrians were wrongly classed as Roman Catholics, or that a similar but inverted mistake has occurred at the present census. Of the two alternatives the former is by far the more probable, inasmuch as in 1901 Romo-Syrians were not separately recorded. In fact a lengthy memorial on the subject, addressed to me by the community before the census, leaves practically no room for doubt on the subject.

63. But after all allowance has been made, it is sufficiently clear that, while the

Roman Catholic Church is at present preponderant, Protestantism is rapidly drawing level. If further proof be needed, it can be found in the marginal figures, which show the rate of increase per 1,000 in the Indian adherents of the several

sects. In seeking an explanation we may dismiss as equally unworthy the suggestions of too zealous controversialists; on the one hand, that the Catholic Church is complacently and consciously indifferent to a retention of Hindu observances by its converts, to an extent that renders their Christianity a mere empty name; on the other, that Protestantism in many cases gains its adherents by direct bribery.

64. Two facts are obvious. One, that Catholicism has been far longer in the field; its missionaries had penetrated into India before some of its competitors had even come into existence anywhere: the other, that Protestantism is now by far the better equipped of the two, in point of material resources, for its undertakings.

65. In the missionary system of the two churches we may notice certain salient points of difference. The Catholic missionary who arrives in India has quitted his native land for good: he remains at his post till death relieves him.* This sacrifice is not required by any Protestant mission, and is in fact prohibited by at least one. Arrived in India the Catholic missionary to a large extent cuts himself off from European society, with which his Protestant confrère keeps in touch; while the Protestant missionary is as a rule assured of a tolerable subsistence, the Catholic priest brings to its highest perfection the art of living upon nothing.

66. As to the theoretical advantages of either course there is something to be said. Prolonged and unchanging residence must undoubtedly gain for the missionary the closer acquaintance of his parishioners; severance of all ties with his native country perforce quickens his interest in the country of his adoption. Again, though it may be doubtful whether a foreigner can ever perfectly comprehend the Indian, he is at least more likely to succeed in his attempt, if he lives entirely with Indians and so, of necessity, in conformity with their mode of life: while renunciation of worldly comfort and advantage implies a certain tinge of that asceticism, which has always appealed powerfully to the religious imagination of the Hindu.

67. On the other hand, experience shows that too prolonged residence in a tropical climate is apt to sap the energy, and dull the enthusiasm of the European. Abandonment of his natural society, for one in most cases on a lower intellectual plane, may approximate priest and parishioner; but may very possibly do so by the bringing down of the priest, rather than by the uplifting of the parishioner; asceticism, however admirable and sympathetic to the Hindu, is yet somewhat reminiscent of the underlying selfishness of the Hindu ideal, wherein the penitent seeks first his own salvation; and in practical life provokes the question whether one's power of doing good is at all proportioned to the discomfort attendant on the doing.

68. But, after all, the ordering of his private life is the missionary's own affair. In forming an estimate of the appeal of Christianity to the Indian, the most important practical point to consider is the attitude adopted by the several churches

* A remarkable example is the career of Father Jarrige, whose missionary life in the country extended from 1819 to 1889.

towards the idea of caste, in which idea, inseparably bound up with the religion of most Southern Hindus, is found the chief stumbling block to conversion. This assertion was vehemently denied, it is true, by Monseigneur Laouenan: "Daily experience proves abundantly that there is no precept of the scriptures or of the Church which cannot be observed, and which is not observed, no Christian virtue which cannot be practised, or which is not practised by those living in conformity with this institution (caste)." But the Archbishop, it may be surmised, had in mind established Christianities, rather than the attempt to establish Christianity; and in respect to this latter endeavour there may be quoted against him the opinion of such early missionaries as Father Caron, S.J., who states that "this institution of caste is a great obstacle to the progress of the gospel, especially in places where we have but few or no Christians;" and Father de la Lane: "This (caste) is one of those obstacles for which there is no remedy. God alone can remove it by some extraordinary means of which we are totally ignorant."

69. To the material advantages of conversion to the outcast allusion has been made in paragraphs 52 and 53; in fairness it must be admitted that permission to maintain the gateless barrier of caste between himself and his humbler brethren may be an inducement quite as potent for the high caste man, as somewhat problematical rice and schools for the Paraiyan.

70. Broadly speaking it may be said that the Catholic Church tolerates, the Protestant Church condemns, this idea of caste. There is doubtless much argument to be advanced on either side: arguments against toleration of Indian Pharisaism suggest themselves readily enough; on the other hand it is a reasonable plea that the high caste convert comes already equipped with a social and religious philosophy, which may be directed and modified, while the attempt to force upon him a totally new scheme of life, unacceptable to a mind moulded by the tradition of centuries, is foredoomed to failure both in theory and practical result.

71. Thus for example Monseigneur Charbonnaux: "The Native congregations of Southern India have been founded on the principle that, to be baptized, a man need not renounce his own caste and nationality; so that though they are not Hindus, if that word be used in a religious sense, if, on the contrary, it is used in its natural and geographical sense, they are Hindus as well as their (fellow) countrymen. They have always been so, and are accepted by all to be so, with the rank and rights of their respective castes."

72. His arguments as well as those of Monseigneur Laouenan seem to be founded on the theory that caste is purely a *social* regulation. It certainly is this, but at the same time is something more: "Caste means to the Hindu more than social standing"—("History of the Telugu Christians" by a Father of the Mill Hill St. Joseph's Society).

73. The great bishop of Drusipare * smote this stubborn rock with the sledge hammer of common-sense, in a letter to his missionaries: "Imagine that the idea of caste with which you have grown up is rooted in you as the roots of your life, that like most Indians you cannot conceive the existence of a civilized society without caste, without those external marks of religion and social standing, which serve as a guide of daily life in your country. Imagine then that a few strangers, whose manners and social customs horrify you, urge you to abandon the worldly beliefs, the religious practices handed down among you from father to son; decry the gods that you adore, and ask you to accept a religion, which you regard as made for persons more spiritual than yourselves, and for you impracticable; ask you to accept them as your spiritual leaders, when their disciples are but objects of contempt for you and for your fellow countrymen!! Do you think that this outraging of your susceptibilities, of your ancient prejudices, would gain anything from you? I think not. Show tact then; handle this people with discretion."

* Monseigneur Bonnard.

74. The practical outcome of the matter is that among high caste people the Roman Catholic Church alone has made appreciable progress. No direct proof, it is true, can be adduced of this assertion, inasmuch as no attempt was made to ascertain the position of converts prior to conversion. It has been controverted by Monseigneur Laouenan "so far as I have been able to observe conversions to Protestantism are comparatively more frequent among the upper castes ; among the lower castes to Catholicism." But he admits that he puts forward this statement with hesitation, and latter day testimony seems to be against him. As an example of such may be quoted the Rev. D. Kuss : " It would appear that the Catholic population of the Telugu-speaking people is in round numbers about 45,000. Of this 78 per cent. is caste and 22 per cent. non-caste."

75. Finally the numerous protests made against this omission by Catholic congregations, and their objections to the inclusive term " Indian Christian," indicate with sufficient clearness that these people deem themselves to possess something which they are solicitous not to lose. The absence of such protest by any Protestant congregation may be taken as an admission that these Christians did not originally possess any caste (Paraiyans), or else have acquiesced in the idea of its abandonment.

76. The Catholic Church is one and indivisible,* Protestant sects tend rather to resemble the sands of the sea. Among non-conformist missions a tendency towards unity has of late manifested itself, resulting in the formation of the " South Indian United Church." The Union includes the London Mission, the American Madura Mission, the American Arcot Mission, and the United Free Church of Scotland. An attempt was made to tabulate the number of persons returning themselves simply as members of this union, or of any body that could be recognized as affiliated to it. The result, which may

London Mission	...	...	...	22,045
American Arcot Mission	...	...	...	5,476
American Madura Mission	...	...	...	14,787
South Indian United Church	...	...	...	2,070

be seen in the margin, is not entirely satisfactory. The United Free Church of Scotland, it will be observed, does not figure at all ; its adherents have obviously

been returned as Presbyterians *tout court* ; possibly as much because of the difficulty that the writing of the church's full name would present to the average enumerator as for any other reason. " Protestants unspecified " who number 11,040, probably include, as well as members of the Anglican Communion, many adherents of well-defined dissenting sects.

77. In table XVII all Christians have been classified in accordance with the established terminology of sect ; not always very happily. For example those belonging to the London Mission have been ranked under " Congregationalist," although that mission is in fact undenominational, and permits considerable latitude as to view of Church Government.

78. The Syrian Church, a thing *sui generis*, is hardly a proselytizing body, although I am informed that at times Indian Roman Catholics, at loggerheads with their parish priest, are wont to inflict an ingenious annoyance on the good man by styling themselves Romo-Syrians, or Syrian Catholics. The remarkable increase in the number of its adherents in Malabar has already been explained. South Canara is the only other district to claim any other appreciable number of the faithful ; these as in 1901 belong to the Jacobite sect.

79. In the census report of 1901 a certain amount of detail was given as to the origin of the different Syrian sects. Recapitulation is unnecessary ; all the more so as an educated Syrian, consulted on the matter, gives it as his opinion that existing differences are of little intrinsic, as opposed to accidental, importance. The interesting point about the community as a whole is its existence as an Eastern Christianity, untrammelled by European or American leading strings. Judging from the frequency of its appearances in Southern Law Courts, the faith is in no danger of dying for lack of the stimulus of internal dissension.

* Theoretically at least. Goa at times seems to have played Barnabas to the Roman Paul with tolerable spirit and success.

(4) ANIMISM.

80. Religions in Imperial table VI, and in the sections of this chapter purporting to give a brief account of each creed, have been arranged in accordance with the numerical importance of their adherents. A closer correlation of "Hinduism" and "Animism" would be more logical and appropriate, in view of the difficulty already alluded to in paragraphs 26 and 27 *supra*, of determining the relation between the highly metaphysical * faith of the speculative Bráhmaṇ, and the more theological * views of many, if not of the majority, of the inhabitants of the Presidency.

81. Column 8 of the standard census schedule provided for entry of the faith professed by each person enumerated. But whereas the followers of well-defined creeds, such as Muhammadanism, Christianity, Buddhism, Zoroastrianism, etc., were unlikely to give anything but a perfectly clear answer as to their beliefs, it was obviously an impossibility to rely on the average enumerator for a scientific discrimination between "Hinduism" and "Animism."

82. Accordingly a rough and ready criterion was applied in the abstraction offices. The entry of "Hindu" in column 8 was accepted as proof of the Hinduism of the person enumerated; while entry there of the name of his tribe, or so-called "caste," was held sufficient warrant for classing him as an Animist.

83. This procedure, adopted from previous usage, has given results satisfactory on the whole, although, as will be noted, involving some curious discrepancies in detail. In view of the assimilative nature and progressive spread of Hinduism, in the last resort a system of social governance rather than of religious faith, it is not surprising to find in the decade a decrease of 3,359, or 5 per 1,000, in the ranks of the Animists. On the other hand an Animistic increase from 3,886 to 65,780 in the district of Nellore is obviously incredible, and as obviously due to the enumerator's theological predilection, which in 1901 returned 62,609 out of 66,318 Yánádis as Hindus, and ten years later classed 64,119 out of 71,797 of the same people as, in point of religion, "Yánádis" pure and simple, and therefore "Animists." Yet the method has given a curiously interesting result, in the disclosure of some 7,000 Animists among the Kápus, whose Hinduism no one calls in question. Were such persons found in Kistna, Nellore, or Cuddapah, the return could be unhesitatingly put down as an enumerator's mistake. Their existence in the Vizagapatam agency suggests, if they be indeed the same people as the Kápus of the plains, the possibility of assimilation to their aboriginal surroundings, so complete as to render them forgetful or careless of their claim to inclusion in Hinduism.

84. Detailed enquiries as to the customs and beliefs of people generally regarded as Animistic, especially with reference to Hinduism, addressed to those in a position to have particular knowledge of the subject, found a ready and courteous response. For much valuable information I have to thank the Rev. J. J. Vulliez, Messrs. A. C. Duff, I.C.S., G. H. Welchman, G. V. Ramamurti, H. R. Bardswell, I.C.S., A. Whitehead, Dinabandha Pandu, B. H. Barlowe-Poole, and many others.

85. It may be assumed that of Animism, whatever it may be, the dwellers in the agency hill tracts are far more truly representative than the wandering tribes of the plains. Of the former I shall take as representative the Khonds and Savaras, both because I have some personal knowledge of these peoples, and inasmuch as the information furnished to me in their respect is fuller and more detailed.

86. It is true that the Khond whose dwelling neighbours on the plains tends to come under the influence of Hindu thought. Resort by the Khonds of the Udayagiri taluk to Hindu temples at Chokkapád, Bellagunta, and Kullada, a pilgrimage probably made with the pious hope of offspring, serves as an example of such tendency. But among the people as a whole there is little trace of an approximation to Hinduism. On the social side, the idea of caste, the touchstone of Hinduism, is not innate in them. The Khond potter, the Khond herdsman, and the Khond

* I use these words in the sense implied in Auguste Comte's law of the three stages. Comte would, I presume, have regarded philosophical Hinduism as a development, natural in point of time, from what is here called Animism.

cultivator will eat together and intermarry : Khond and Páno will drink together.* Restrictions there are in point of marriage; the Khond will not recognize as a Khond the offspring of a union between Khond and Dombo, or Gahanju and Khond. But this refusal springs from the European idea of class, rather than from the Indian idea of caste; the Khond regarding himself as the social superior of Dombo or Gahanju.

87. Again among this people the idea of permanence of marriage, at least on the woman's side, and of female chastity anterior to marriage does not obtain. A marriage is readily dissolved; it may be for reasons, such as sterility or lack of male offspring, similar to those prevailing among Hindus; but such dissolution is no bar to another alliance on the part of the wife. The total absence of any ideas as to female chastity is sufficiently indicated by the fact that "unmarried" Khonds of either sex live, not separately and in their parents' houses, but promiscuously in a building allotted for this purpose.

88. On the purely religious side, it may be said that the Hindu doctrines of Karma and re-incarnation are absent. The former is beyond the Khond's mental grasp; as is doubtless the latter in its Hindu form. Mr. Duff mentions one case in which a Páno, at a Khond birth ceremony, suggested that the soul of an ancestor had entered into the new-born infant; but he points out that Pános, although often Khond speakers, and not too readily distinguishable by strangers from Khonds, have long had more intercourse with the Hindu plains than the Khonds. An idea of the spirit's survival after death, and of its possible temporary transference during life-time, undoubtedly exists; the belief being universal that the spirit of a man killed by a tiger guides the tiger in his search for a fresh victim; while a frequent cause of divorce is the assertion of a husband that his wife has become a nocturnal tiger, preying on the children, fowls, pigs, etc., of the village. Again on the third day after a natural death is performed a ceremony known as "*pideri tapku*" (bringing of the devil). A spider (*Kruma-croho*) is brought from the burning ground, kept for a day, and propitiated with rice, meat, and a new cloth, apparently under the idea that it represents a malignant re-incarnation of the deceased. A woman dying in child-birth becomes a "*silungudi*," a fearsome devil, whose malevolence takes the curious form of making her brothers-in-law laugh themselves to death. A precautionary measure is to nail the corpse to the pyre by forehead, hands, feet, wrists, knees, fingers, and toes.

89. It is when we descend to the detail of what the Khond does believe, from the generality of what he does not, that the difficulty of distinguishing his Animism from the Hinduism of the uncultured villager becomes fully apparent. An account of his divinities † would serve, with very small modification, for a description of the ordinary Hindu village deities and their worship.

90. Chief of the Khond gods is *Bura Pěnu* with his wife *Pitěri* (possibly a Khond form of *Pidari*). He is worshipped as god above (*Sěndo Pěnu*), and god beneath (*Nědě Pěnu*). He is the creator of mankind, and has under him a host of subordinate gods.

91. *Dondo Pěnu*, the god of punishment, dwells amid some sacred trees near every Khond village. Cut one of his trees, and you die quickly and unpleasantly.

92. *Loha Pěnu*, the god of iron, directs your arrows against the foeman, and averts their countershafts.

93. *Odu Pěnu*, god of the outside, undertakes the general surveillance of the village, which he may not enter. In his task he is assisted by *Dandere Pěnu*, the door-keeper, who guards the back of the village, for a fee of fowls and eggs; by *Darni Pěnu*, who watches the inside of the village from beneath a heap of stones,

* I saw a hillman refuse food offered by my Bráhmaṇ assistant. But in the refusal there was no idea of caste: he refused "because I do not know you, and I am afraid of you." He was quite ready to accept a meal from a local Hindu official, whom his experience had shown him to be innocent of poisoning or purging design.

† For this present account I am indebted in particular to the Rev. J. J. Vulliez.

where he dwells in the fragrant companionship of a rotten egg ; by *Teki Pénu*, the god of vessels, who guards the property of the house ; and by *Goheli Pénu*, god of the stable, who protects the animals from marauding tigers.

94. *Karang Pénu*, the unknown god, requires propitiation when a person sickens without apparent cause ; *Djodi Pénu* of the rivers protects women with child ; *Oda Pénu* drives birds and beasts from the crop.

95. This list does not exhaust the worshipful capacities of the Khond. *Murdo* and *Rugo* (small-pox and cholera) figure on his list on the way from Kurtuli to Mahasingi dwells a god, whose chief activity consists in the asking for tobacco ; the god of precipices is found on the road to Korada ; the hot spring of *Taptapáni* receives frequent *púja*. If ancestor worship, strictly speaking, does not prevail, there are stories of *Tummeri*, who founded Tummeribund, and of the giant Khonds, who brought the Nolobhonsos to Mahasingi.

96. It may be that Khond's hilly inaccessible country, with its feverish climate, has prevented the intersection of his orbit with that of so-called Hinduism. Did opportunity offer, he would probably enter the Hindu fold, bringing with him his gods, as easily as many another Dravidian demon-worshipper has done, and receive in time a tincture of deeper and more spiritual religious ideas, with a greater fixity and seemliness in his social regulations.

97. The religious beliefs of Savaras appear to have undergone considerable modification in the decade that is past. In 1901 of 183,159 Savaras but 24,306 were classed as Hindus ; a total which has more than doubled in 1911, when 56,052 out of 186,128 are so described.

98. Of the Savaras of Rámagiri, and those of Parlákimedi, I have received detailed information from Messrs. Dinabandha Pandu and G. H. Welchman. The complete disagreement of their accounts, which in each case are founded on undoubted knowledge of the people described, indicates the difficulty of any general statement as to religious belief.

99. Mr. Dinabandha Pandu divides the Rámagiri Savaras into nine sections, of which he considers five to be Hindu for all practical purposes, and four purely Animistic. Mr. Welchman considers his Savaras as so slightly tintured with Hinduism as to be without its pale, but curiously enough finds among them some faint trace of Buddhistic ideas.

100. If they do not worship the diseases themselves, the Animistic Savaras of Rámagiri are wont to propitiate certain divinities on the outbreak of cholera or small-pox. Although one of such deities has a Hindu name, *Tákuráni*, the Savaras specifically deny its connection with the Hindu pantheon. By certain sections though not by all *Thallia*, symbolized by a stone kept in each house, with a bundle of peacocks' feathers by its side, is worshipped at the time of eating new crop ; as is *Ghausi*, a deity for whom there is no material symbol. *Korono*, an earthen pot hanging from the roof and containing rice, is worshipped at seed time ; for abundance of crops *Gangi*, a stone placed under a tree, is addressed. *Dwaria* and *Budima*, likewise represented by stones ; are worshipped respectively at times of harvest or epidemic ; *Sapua* and *Kitum* find worshippers in Chandragiri alone.

101. The Savaras of Parlákimedi, in addition to a somewhat miscellaneous worship of natural objects, are wont to call upon their ancestors, who in general are regarded as rather harmful than otherwise. In their social relations, especially in point of permanence of marriage and pre-nuptial chastity of women, they show a closer approximation to Hinduism than do their fellow Savaras of Rámagiri, whose morality appears to be on a par with that of the Khonds.

102. There are certain other lines of enquiry by which I endeavoured to obtain some precise ideas as to the spiritual beliefs and tendencies of these people. Among such may be instanced questions as to whether they accept priests or gurus from among Hindus, as to the existence among them of totemistic ideas, as to the names conferred by them on their children.

103. My informants agree that, in general, these people neither ask for, nor accept, Hindu religious attentions, nor are such proffered by undoubted Hindus. One curious exception, it is true, is noted by Mr. Duff in the case of a shrine near Digi, where a Bráhmaṇa pújári is supported by Khond offerings.

104. Father Vulliez finds three totemistic septs among the Khonds of Udayagiri and Balliguda. These septs are in the main exogamous although the strictness of prohibition is gradually growing less; the *Muttokas*, descended from a peacock's egg, seeking mates among the *Goldekas*, who spring from the egg of the *Olangpota* (a small bird), or the *Sorengas*, the lordly progeny of a dung-worm. How far each sept now reveres its totem is a matter of uncertainty: the *Muttokas* at least have no objection to eating the peacock.

105. Chenchu names, taken in the main from Hindu mythology, point to the correctness of classing this tribe of the Nallamalai forests as Hindus. Khond names are varied and peculiar: * certain Savaras show a predilection for the days of the week; a system of nomenclature convenient in many respects, but possibly rendering distinction of sex by name somewhat difficult.

106. Unless the padding out of a census report be regarded as a work of practical utility, it would serve no useful purpose to labour through the names of godlings adored by tribes reputed to halt between Hinduism and Animism, and the fashion of their adoration. Name and worship are but the vesture of the underlying idea, and enough has perhaps been said, to indicate the impossibility of drawing a clear distinction between popular Hinduism and so called Animistic worship. Hinduism, its adherents claim, can find accommodation for all stages of intellectual development; if, from the statistical point of view, a European atheist can be a Christian, there is no apparent reason why an Indian animist should not be a Hindu.

* I once met a Khond called Doctor. Some difficulties attendant on his entrance to the world were surmounted by a Hospital Assistant who chanced to be on the spot: the name of the infant commemorated the occasion. I know of a Toda who answers to the weird appellation of "Deadlegs;" such is the translation of his name. But apparently this is a nickname, to the bestowing of which these strange people are addicted.

CHAPTER V.—AGE.

OF all chapters, for which custom demands inclusion in a census report, the dealing with the ages of the people is by far the most unsatisfactory from the point of view of the ordinary writer. Even were the ages returned approximately correct as they are in the better educated sections of European populations, their scientific treatment requires a mathematical proficiency not ordinarily possessed save by those whose profession lies in the exercise of such knowledge, and to which I certainly cannot lay the faintest claim. Some crude methods of figure adjustment must necessarily be learned for the general purposes of a census office; but in view of the fact that the age returns of this Province among others will be examined and adjusted by an expert, amateur effort in this direction would be little short of ridiculous.

2. The hopelessness of a literal acceptance of the ages returned at the various Madras enumerations may be seen readily enough from a few concrete examples. There were in 1891 some two and a half million of female toddlers at the ages of 5-10. Ten years later, when they should have ranged from 15-20, nearly a million of these little ladies had passed away. But this loss found a sort of compensation, for in 1901 there were respectively some 22,000, and 197,000 more girls at the ages of 20-25, and 25-30, than there had been girls of 10-15, and 15-20, in 1891.

3. These figures show a certain improvement in 1911. Girls aged 0-5 in 1901, who numbered 2,679,818, are represented by 2,318,878 survivors at the ages 10-15; the loss of 361 thousand being less startling and more credible than that of a million just noticed in the previous decade. The same fairly probable rate of decrease is observable at the next age period; of 2,232,108 girls aged 10-15 in 1901, 218,658 have passed away before attaining the period 20-25. But anomalies are not slow in coming; the girls of 15-20 in 1901 have received a mysterious accession to their ranks of 294,150 at the age period 25-30 in 1911; male infants of 0-5 in 1901, clinging to life with teeth and claws, have reached the period 10-15 in 1911 losing but 34,363 of their numbers by the way.* Their brothers aged 10-15 in

* 1901	...	...	0-5	...	...	2,548,734	1901 seem to have been more loved by the gods, for well nigh eight hundred thousand of them have disappeared from those of 20-25 years in 1911†: but the young men of 15-20 have thriven exceedingly, for on their march through the years they have enlisted 62,256 recruits ‡.
1911	...	...	10-15	...	...	2,514,371	
† 1901	...	...	10-15	...	...	2,474,166	
1911	...	...	20-25	...	...	1,682,335	
‡ 1901	...	...	15-20	...	...	1,570,483

4. Such inferences as may be drawn from the figures as they stand are not rendered more reliable by presumption, referred to in paragraph 3, of an increasing intelligence in enumeration, or an increasing accuracy on the part of those enumerated; inasmuch as these tend to a variation from decade to decade in the percentage of error. It is however worth considering whether some attempt may not be made to assign the general causes of error underlying these strange figures.

5. First among such causes is the undoubted tendency of the general Indian to measure time and space by periods in relation to the happenings of every day life, rather than by exact arithmetical standards. In the Ceded districts the expression

“half age” used of a man implies that he is about 25; it does not imply a general

age limit of 50, for proportionately, as may be seen from the marginal figures extracted from subsidiary table II, these people are longlived; but rather that, regarding 50 as the time limit of man's full activity, a man aged 25 has accomplished half of his journey to the commencement of decline. Distance on the West Coast is frequently estimated by the number of paces that limit the approach of an outcast to his holier brother;³ hours of the day everywhere by the sun's height above the horizon

measured in palmyra trees. A year or two making but little difference either way, the five-year periods stand out in relief against the single intervening years, as do mile stones on a road against the furlong stones which they enclose. Hence we can understand the curious agglomeration at the decennial age periods, and roughly speaking at the middle term of these periods, shown by subsidiary table I.

6. A more specific cause of error can be assigned to the vagaries of female age periods. Whether for the reasons described in a succeeding chapter, or from un-reasoning obedience to custom, the Indian is, or has been, apt to look upon it as a potentiality of social discredit if his daughter remains unprovided with a husband at the earliest moment at which nature permits a possibility of motherhood. At the same time there may be some dim recognition that this mental attitude is not altogether self complimentary, and accordingly, once she is married, the age of the Indian daughter takes a sudden leap forward.

7. This conjecture affords a fairly plausible explanation of the curious figures of 1891 and 1901. Of the girls aged 5-10 in 1891, probably some were a great deal older, but were unmarried. The loss of a million at the age period 15-20, and the impossible increase at the two succeeding periods in 1901, may be due partly to death; but more largely to the fact that on marriage these girls were either placed in their proper age class, or their ages artificially increased.

8. The figures of 1911 regarding these female age periods may then denote, with improving accuracy of enumeration, a great and welcome step forward in the raising of the marriage age in Madras; or else, unfortunately, a wider acceptance of the pernicious custom of infant marriage.

9. Assuming as suggested in paragraph 5 that the Indian, if he does not know his exact age, has yet a fairly clear idea as to his age period,[†] it is worth while trying to discover what may be these age periods. Giving precedence to males, Ramaswami from 0-5 is a “child” clad in native worth, playing with his fellow urchins in the street. From 5-15 he is in some sense a school boy, whether he sits beneath the ferule of the village dominie, or that of his big brother. From 15-20 he joins the student or apprentice class, and from 20-45 exercises the vigorous functions of a householder. When he admits to 45 and more, it is probable that his sun is wester-ing, and that his thoughts turn in Irish parlance to the “making of his soul.”

10. His sister from 0-5 enjoys her childhood; and from 5 to 10 her prospective marriage distracts her parents. From 10-15 she is in a transition between her father's house and that of her mother-in-law; from 15 to 35 or 40 she strongly pounds rice and produces children; and from 40 onwards consecrates herself to religion, and the stern upbringing of her son's wife.

* A remarkable measure of distance in Southern Ireland is “the roar of an ass.”

† Dr. Khajja Muhammad Hussain of Banganapalle furnished me with some illustrations confirming this theory. He enquired of some hundreds of patients their ages; although some answers were wildly absurd—a few considered such enquiries impious—yet on the whole most people were found to have a fairly correct idea as to the period of their age. After 45-50 answers became very vague; 50, 60, 70-100 were returned at random.

Men.

Year.	0-5	5-15	15-20	20-45	45 and over.
1911	1,333	2,554	876	3,587	1,656
1901	1,339	2,734	825	3,551	1,551
1891	1,482	2,475	828	3,731	1,484

Women.

Year.	0-5	5-10	10-15	15-35	35 and over.
1911	1,341	1,312	1061	3,444	2,812
1901	1,368	1,406	1,140	3,335	2,751
1891	1,524	1,346	923	3,506	2,701

women I have decreased by five years, on the basis of information as to the general child-bearing age of Indian women given to me by the Superintendent of the Maternity Hospital, Madras, who has tabulated, as in the margin, the age periods of nearly 6,000 births that came under his notice between 1907 and 1909. Child-birth after 35 is of course not impossible, but Colonel Giffard considers that the majority of births after 30 took place within the limit of 35, and that, as a general standard of reproductive age for the women of Southern India, the period 15-35 is preferable to 15-40.

13. Subsidiary table VI shows the variation of the population throughout the Presidency and its divisions at certain age periods, and in the notes appended to this table are mentioned sundry abnormal factors which have exercised a disturbing influence on the figures. The effect produced by inter-provincial and inter-district transfers is obviously unreal, but it is interesting to note that even still we have in some degree to reckon with the *sequelae* of the great famine of 1877-78.

14. The direct consequences of severe famine are fairly obvious. It kills the aged and infirm; a result rather beneficial than otherwise to the general health of the community, if consideration of such health be divorced entirely from natural human feeling. At the same time the weakly infant class, which must needs suffer directly, is for a short period even more strongly affected indirectly, owing to temporary loss of reproductive power by those then at the reproductive period of life. This latter loss however finds a compensation in the fact that the survivors of a great famine represent the survival of the fittest, and potentially the most productive; while a rebound or stimulus in the direction of actual productivity appears to be Nature's invariable method of making good her losses.

15. But although we are not yet free from the influences of this famine—they can be seen for example in the gradual increase of the number of both sexes at the ultimate age periods, and in the shortage of adolescents, (boys and girls aged 5-15), in 1891,* which must necessarily affect potentialities of increase twenty years later—the subject has received adequate discussion in previous census reports.

16. Subsidiary table VI analyses the increase of the last two decades into increases at particular age periods. The salient feature of the decade 1891-1901 was an extraordinary increase at the age period 10-15, which may be explained by the supposition that the natality of 1877-78, or survival of infants born at that time, was exceedingly low, and that those aged 14, 13, and 12 in 1891 were correspondingly few. The same cause persists in the contrast of the figures at the period 15-40 for both decades.

* Vide paragraph 11 *supra*.

17. Although it speaks well for the years that are past, for those to come it may not be of altogether hopeful augury that the chief increase of this decade has been at the period of old age (60 and over). But to argue that this fact *per se* augurs ill for the immediate future is hardly fair; inasmuch as the absolute number of those at this advanced age is, comparatively speaking, so small that a small absolute variation, when looked at proportionately, can easily assume a disproportionate importance. The number of these aged persons, in proportion to those in the prime of life (15-40), has not risen appreciably since 1901; and it is interesting to note that such increase as has taken place since 1891 is entirely among male section of the population. But subsidiary table V discloses some figures which look unpromising. The proportion of children, (10 and under), to the population aged 15-40, and to the number of married women of this age, is now markedly lower than it was in 1901 or 1891; while the proportion of married women aged 15-40 to the total female population is appreciably higher than in 1901, and only very slightly lower than in 1891.

18. At paragraph 11 were quoted certain figures showing the age distribution of the population in 1891, 1901, and 1911. From these it may be possible to obtain some deductions, which may serve to indicate the tendencies during each decade, and the position and prospects at the end of a twenty-year period, in comparison with the beginning. I put these speculations forward with extreme diffidence, inasmuch as they represent in some sense an excursion into hypothetical regions with which I am entirely unfamiliar.

19. The method by which the figures quoted in the margin have been obtained is sufficiently obvious. It

Period.	Males.				
	Infants.	Adolescents.		House holders.	Old people.
	0-5	5-15	15-20	20-45	45 and over.
1891-1901	- 143	+ 259	- 3	- 180	+ 67
1901-1911	- 6	- 180	+ 51	+ 36	+ 99
1911 compared with 1891.	- 149	+ 79	+ 48	- 144	+ 166

is clear that, whatever may have been the cause, "house holders" and "infants" fared badly during the decade 1891-1901: this is as marked on the female as on male side. Grouping the second and third age periods for each sex respectively we find that these classes fared well; their significant figures being + 256 for males, and + 277 for females, as against - 143 and - 156 in the infant, and - 180 and - 171 in the household classes, for the respective sexes.

Period.	Females.				
	0-5	5-10	10-15	15-35	35 and over.
1891-1901	- 156	+ 60	+ 217	- 171	+ 50
1901-1911	- 27	- 94	- 49	+ 109	+ 61
1911 compared with 1891.	- 183	- 34	+ 168	- 62	+ 111

20. As to the causes of this phenomenon, we may take into consideration the after effects of 1877-78 famine, which would be strongly marked in the case of women aged 15-35 in 1901; and also the unfavourable nature of the decade 1891-1901, to which allusion has

been made in Chapter II. This would have a certain effect on the adult classes, which, although best fitted for survival, have yet to meet the chiefest stress of such a time; and which, in addition to positive casualties, and actual loss of children, suffer as regards the power of reproduction. The classes at 5-20 among males, and 5-15 among females, are over the first weaknesses of infancy, but are still among the ranks of the protected rather than of the protecting. These adolescents, (the term will serve in default of a better), have carried their vitality through the next decade; as we find that in 1911 the householders, (potential fathers and mothers), have changed the number, which indicates their distribution in the total population as compared with 1901, from -180 to + 36 among men, and from -171 to + 109 among women. Their joint efforts appear to be directed

towards an amending of the lamentable infant figure of 1891-1901, for although the position of 1911 is slightly worse than that of 1901, the former year makes a far better showing in regard to the latter than did 1901 when compared with 1891.

21. Decade 1891-1901 showed then a bad position among householders and infants, but great possibilities in its adolescent strength for a speedy repair of this state of things. The ensuing decade did in a large measure actualize these possibilities. It is possible that the characteristics of the first decade will reappear in the decade 1911-21, inasmuch as the decade 1901-11 shows a weakening in adolescents, which may more than counteract the improvement in the infant index that the improved adult position is likely to effect.

22. There are certain further deductions indicated by the subsidiary tables in respect of birth and death rates, causes of death, etc. But practically all such information has been utilized, directly or indirectly, in the chapters dealing with the movement of the population, sex, civil condition, etc., and repetition here is unnecessary.

23. Subsidiary table IV, which shows the age distribution of certain castes, is based on Imperial table XIV, which was compiled for a different purpose, and wherein the population has been taken from a few representative areas, and not over the whole area of the Presidency. It does not appear to present any feature of particular interest. It may be noted that in respect of men in the prime of life the position of the Bráhmán sub-divisions is strong, but in point of infants (0-5), both male and female, they compare somewhat unfavourably with other selected castes. A reason for a paucity of girls aged 12-15 has already been suggested; it is curious that among Embrándri Bráhmans the girls at this age considerably outnumber the boys.

East Coast (Central) ... {	(c) 1901-1911	+ 5.4	— 1.7	— 0.7	+ 10.5	+ 9.0	+ 11.6
	1891-1901	+ 8.9	+ 5.5	(d) + 43.7	+ 1.4	+ 13.5	+ 10.8
East Coast (South) ... {	1901-1911	+ 1.5	+ 10.3	+ 10.2	+ 17.0	+ 17.0	+ 19.3
	1891-1901	+ 5.4	+ 3.1	(d) + 22.1	+ 2.5	+ 7.0	+ 4.6
West Coast ... {	1901-1911	+ 7.1	+ 4.5	— 0.7	+ 10.6	+ 8.9	+ 8.0
	1891-1901	+ 6.3	+ 0.8	(d) + 20.2	+ 5.7	+ 8.5	+ 3.2

Note.—The percentages are based on variations in unadjusted figures for previous censuses. For 1891, persons who have not stated their ages have been omitted in working out percentages for columns 4 to 8 but have been included for column 3.

(a) High increase in all age periods between 1901-11 is partly due to inclusion of Nngur in 1911. The high increase between 1891-1901 in Agency Division, may be due to exclusion of 'not stated' from 1891 figures.

(b) Figures for 1901 include Madanspalle and Váyalpád taluks now transferred to Chittoor.

(c) Slight fall in two age periods only is due partly to transfer of Karúr and Námakkal from this Division to Trichinopoly

(d) Probably due to small number of births during 1877-78 famine.

VII.—Reported birth-rate by Sex and Natural Divisions.

Year.	Number of births per 1,000 of total population. (Census of 1901).											
	Province.		Agency and East Coast (North).		Deccan.		East Coast (Central).		East Coast (South).		West Coast.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.

* Accurate details by sexes and districts are not available previous to 1905; the number of attacks in 1901 is 3,960; deaths in 1902, 10,795; 3, 13,291; 1,904, 20,125. See footnote to the previous subsidiary table.

CHAPTER VI.—SEX.

ONE of the most interesting results obtained by the census is the knowledge of the proportion of the sexes (*a*) in India, (*b*) in the Presidency, (*c*) in each district of the Presidency. With India I am not concerned, save in so far as to remark that the ratio of the last census (953 per thousand) is the opposite to that prevailing in Europe, where, with the exception of the south-eastern corner, the women, according to the latest information available, are found to outnumber the men.

Country.	Year of census.	Number of females per 1,000 males.
England and Wales	1911	1,068
Scotland	1911	1,063
Ireland	1911	1,004
Holland	1909	1,015
German Empire	1910	1,026
Denmark	1911	1,061
Sweden	1910	1,046
Bulgaria	1905	962
Servia	1900	946
Roumania	1899	968

2. In the Madras Presidency, taken as a whole, the facts ascertained at the census of 1911 correspond to European experience; the ratio of females to males being 1032: 1000. From subsidiary table I, it may be seen that in point both of “actual” and “natural” population this general proportion has been found to exist at the last three decennial enumerations, and the disparity in the former case appears to increase steadily if slowly as the years go by.

3. A recent statistical writer in England finds in the preponderance of women a sufficient reason for the diversion of their domestic energies towards a pressing of their claim to political recognition. Such happening is hardly as yet within the range of practical politics in Southern India, nor need our rest be disturbed by an attempt to forecast the ultimate practical result of this sex tendency.

4. At the last census the Presidency was divided into 32 territorial units. Strictly speaking Madras, including its capital, comprises 25 “districts;” but for the purposes of the census it is customary to include the States of Pudukkóttai, Banganapalle and Sandúr; and to treat separately the Agency tracts of Ganjám, Vizagapatam, and Gódávári, and little enclave of Anjengo.

5. In fourteen of these units females were found to be in defect. From this number we may exclude for present purposes the three Agency tracts, because of the probability of faulty enumeration to which attention is drawn in Chapters I and II; Madras City, because of the generally observed tendency towards a larger male population in the large cities of India; the Nilgiris, mainly because of a large immigration of male labourers to coffee and tea estates. But the figures of this district deserve some further remark, in view of the fact that the defect of women is much more strongly marked in the actual than in the natural population; while among the persons born in the Nilgiris, and there enumerated (table XI), the sex proportions are practically equal. The explanation, which local knowledge confirms, may be found in the fact that the district holds, in addition to its imported plantation labourers, a large proportion of immigrants for various other purposes, (only 670 per 1,000 of the actual population were born in the Nilgiris), to whom the climate is on the whole uncongenial, and who find it as difficult to keep their women-kind on the hills as Europeans do to keep them on the plains. Among the Badagas, characteristically the people of the district, women outnumber men, as they do among Indian Christians, who may in general be assumed to be natives of the locality where they are found.

6. Despite the evidence of table VI and subsidiary table I to this chapter, I should be inclined to add Sandúr to this list. There is no apparent reason for a sudden and marked change in the actual female population, and the variation between actual and natural population, which the figures imply, is too great to be easily credible. As exemplified in the case of Banganapalle at the census of 1901,

the return of birth-place in these tiny states lying within the confines of one British district is one of very doubtful reliability; and the purely arbitrary nature of the frontier renders a variation of the actual population, in reality small when the smallness of the total figures is considered, largely a matter of chance.

District.	Women per 1,000 men in actual popula- tion in 1911.
Guntúr	982
Nellore	996
Cuddapah	969
Kurnool	934
Bellary	975
Anantapur	949
Chingleput	993
Chittoor	968

7. However this may be we are left with eight considerable units, (I exclude Banganapalle both on account of its size, and of its practical homogeneity with Kurnool), where actual (and natural) sex proportion differs from that of Madras in general. Or in other words while the excess of females in the Presidency is 658,144, the defect in these districts is 102,795.

8. European statistics, presumably reliable, appear to show an excess of males at birth, with a reversal of the ratio in later years. The vital statistics for the Presidency, set forth in subsidiary table V, show that, so far as births are concerned, the sex ratio tallies with that of Europe. At the age periods 0-5, and 5-10, girls outnumber boys; but at the periods 10-15 and 15-20 the proportion undergoes a change, the male sex, especially at the earlier period, being in excess. From 20 to 35 females again preponderate. From 35 onwards the pendulum oscillates according to quinquennial periods, a result probably due to as much to the haphazard inaccuracy of particular age returns as anything else; but in the result there is a female preponderance of 39,103.

9. It is worth while examining these figures in connection with three main religions of the Presidency. As to the number of births among the followers of each religion information is not procurable; but, as the result of the census, all save Animism show a preponderance of females over males. At the age period 0-5 among Hindus, Muhammadans, and Christians, girls are in the majority, as they are among the first and third at 5-10, when among Muhammadans the sexes are practically equal. At 10-15 males are in excess, as they are at 15-20 among Hindus, though not among Muhammadans and Christians. From 20-25 the sex proportion in each religion tallies with that of the Presidency: from 35 onwards women are in excess among Hindus, in a minority among Muhammadans and Christians. The curious quinquennial variation already noticed is exactly the same among Hindu and Muhammadan as in the general population, but among Christians there is a steady preponderance of men from 55 onwards.

10. The accuracy of the Indian sex returns has been challenged by continental statisticians, on the grounds that the general defect of women is due to the reluctance of the people to disclose even the existence of their womenkind. The foregoing figures show that this argument fails to touch Madras as a whole, or any considerable section of the people living therein; unless, from an observed increase in the proportion of women to men at succeeding enumerations, we conclude that the *real* number of females in the Presidency is vastly greater than that of men; a hypothesis which fails to explain local *decrease* observable in many instances. Men indeed predominate among the "Animists," and some smaller religious communities, but these people are too few in number to warrant the drawing of any general conclusion from facts observed in their particular case. Moreover the exceeding vagueness of the term "Animist," coupled with local difficulties of enumeration, renders it probable that such error, as in this case occurs, may be that of the enumerator quite as much as of those enumerated.

11. There may be a probability of error in respect to the return of girls at the nubile age, especially if such girls be unmarried. But such error is far more likely to be caused by mis-statement of age than by absolute concealment of existence. Such concealment is indeed improbable, when it is remembered that seclusion of women, other than Muhammadan or Oriyá, is comparatively rare in the Presidency, and that, while in most districts the ascertained number of Muhammadans is too small to affect appreciably the general figures, in Malabar and South Canara, which

return by far the highest percentage of Muhammadans, women preponderate, as they do in the general Muhammadan community, and among the Oriyá castes.

12. In respect to the existence of girls at the age period 10–15 a few figures may be given. They show that such

Number of girls aged 10–15 per 1,000 of female population.

Total	...	...	...	...	...	...	109
Hindus	...	...	...	...	...	...	108
Muhammadans	...	...	...	...	...	...	116
Christians	...	...	...	...	...	...	116

in the Hindu community. Misstatement

of age at this period, at least among Hindus, becomes more apparent when the proportion of unmarried girls at the age of 10–15 to the total number of girls at this age is considered, with reference to the general population of the Presidency, and to the three main religions.

Number of girls unmarried at 10–15 per 1,000 girls at this age.

Total	...	...	...	...	...	...	740
Hindus	...	...	...	...	...	...	723
Muhammadans	...	...	...	...	...	...	855
Christians	...	...	...	...	...	...	915

13. Subsidiary tables V and VI disclose nothing calculated to render unwarrantable the assumption that an excess of females over males is the normal condition of the Presidency. They show that male births are more numerous than female—a fact of which the accordance with general experience discounts neglect or unwillingness to register female births; the comparative equality of deaths at the age period 1–5 is due in all probability to the greater solicitude shown for boys, whose deaths at this age should outnumber those of girls; the ominous preponderance of female mortality between 15 and 30 is eloquent of the risks of Indian motherhood. That at the ultimate age period female deaths should exceed male, appears a necessary consequence of the considerable preponderance of women at this age shown by subsidiary table II.

14. To explain the general defect of women in India the existence of certain conditions, tending to produce a high female mortality, has been suggested. Among such conditions may be—

- (a) Neglect of female infants, for whom the procuring of a husband would be an occasion of expense;
- (b) Infant marriage, involving premature sexual intercourse and child-bearing;
- (c) A high birth-rate, combined with unskilful midwifery;
- (d) Confinement and semi-starvation of women at puberty, during their menstrual periods, and after child-birth.

15. But as applicable only to a particular area within the Presidency these explanations scarcely hold good; inasmuch as there is no reason to suppose that such customs exist in greater force in the eight districts concerned than elsewhere. At the same time a few figures illustrating the prevalence of immature marriage in these districts and elsewhere may be given.

Number of females among whom one under 15 is married.

Guntúr	...	...	...	...	...	...	19
Nellore	...	...	...	...	...	...	32
Cuddapah	...	...	...	...	...	...	28
Kurnool	...	...	...	...	...	...	21
Bellary	...	...	...	...	...	...	19
Anantapur	...	...	...	...	...	...	24
Chingleput	...	...	...	...	...	...	37
Chittoor	...	...	...	...	...	...	33

16. The figures in the margin contrast the number of women married at the ages 0–15 with the total female population. Those widowed at these ages have been excluded, because presumably they are not subjected to the disturbing influences mentioned in paragraph 14 (b).

17. In contrast with certain districts where women outnumber men these figures appear illuminative: in Malabar but one woman out of 81 is a married woman of this tender age; in Madura one of 87, in Tanjore one of 62, in South Arcot one of 38. But the explanation fails, when we notice that in Ganjám, where the proportion of women to men is highest, one woman out of every 10 is a married woman aged between 0 and 15; in Vizagapatam the proportion is even higher, being one out of 9; in Gódávári it is one out of 15; in Kistna, one out of 17.

18. A further caution is necessary. If the deficiency of females is attributable to any one or all of the causes noted in paragraph 14, it is hardly reasonable to

suppose that such causes persist with equal force in all sections of the people irrespective of race, creed or education. We might expect a surplus of females in some sections counterbalanced by a marked deficiency in others.

19. Assuming that, in the case of Hindus, difference of mother-tongue is equivalent to difference of race in Southern India, it will be of interest to note the sex proportions, according to linguistic division, in these districts and some others.

District.	Tamil.		Telugu.		Oriyá.		Canarese.

Anantapur	8,836	7,983	390,362	371,474	...	...	42,068	39,780
Chingleput	553,741	549,693	110,359	110,338	...	...	...	...
Chittoor	79,518	79,925	492,913	475,628	...	...	13,547	13,923
North Arcot	715,458	726,923	154,529	157,709	...	...	14,870	15,481
Salem	635,579	651,790	170,474	167,895	...	...	28,330	28,181
Coimbatore	686,484	706,126	237,321	242,985	...	...	83,957	87,114
Ganjám	21,858	32,755	397,530	465,922	394,830	448,352	2,216	2,036
Vizagapatam	11,202	12,163	960,962	1,025,333	35,123	37,530	4,907	4,915
Gó dávari	26,048	30,608	647,775	672,715	2,661	2,926	2,887	2,753

20. From these figures it can be seen that in all eight districts Telugu males outnumber Telugu females, as they do in the "normal" district of Salem. But the inference that male predominance is characteristic of the Telugus is scarcely borne out by observation of such figures as those for North Arcot, Ganjám, Vizagapatam, and Gó dávari; and of the fact that the Canarese men of Bellary and Anantapur likewise outnumber the women; while a reversal of the proportion is found in the considerable Canarese population of Coimbatore.

21. But *Race* in Southern India is complicated by considerations of caste and religion as well as by those of language. Accordingly, assuming that the Hindus of Chingleput are represented by Tamils, and those of the other districts by Telugus, I have tabulated the sex proportions for each section of the people that contributed approximately 10,000 of either sex to the sum total. Inasmuch as the statement is rather unwieldy I have placed it at the back of the subsidiary tables appended to this chapter (appendix I).

22. These figures do not seem to furnish us with any solution of the problem. Male predominance is, on the whole, fairly well marked throughout all *strata* of the population; while the total numbers show that the sections dealt with are tolerably representative of the district population. It is worthy of note that omission of Canarese-speaking Hindus from the population of Bellary has considerably accentuated the deficiency of females, and that Chingleput, the one Tamil district, shows a proportionately greater number of castes wherein females outnumber males.

23. Lastly, if we take as fairly typical the districts of Chingleput, Kurnool, and Guntúr, Provincial table II gives us the proportion of the sexes in the main religious communities in each taluk of these districts, and the figures are available for the drawing of such conclusions as may suggest themselves to the ingenious reader.

24. An intolerable deal of sack to a very scanty morsel of bread represents so far, I fear, the treatment of this question. Yet the foregoing remarks may serve some useful purpose if they indicate that explanation is to be found not in the social customs or racial peculiarities of the people, but rather in the conditions of the locality in which they reside.

25. For reasons mentioned elsewhere it must be admitted that emigration returns are of little value in regard to such comparatively small areas as districts. Indeed so difficult did it prove to ascertain accurately the birth districts of Madrasis enumerated outside the Presidency that the "natural population" of districts, shown in subsidiary table I, was at first calculated solely with reference to migration within the Presidency. It may, however, be taken for granted that emigration is a factor of very small importance in at least five of these eight districts, namely Kurnool, Cuddapah, Anantapur, Bellary, and Chittoor. They are landlocked, and the idea of crossing the sea is not likely to reach, or, if it reaches, to appeal to the adventurous youth of these parts. Guntúr, Nellore, and Chingleput have a certain number of their taluks on the sea board, but possess no central ports of embarkation. And when all allowance has been made for the fact that the emigrant is usually accredited to the district wherein he embarks, it is a matter of fairly common knowledge that there is no movement from these districts comparable to the outflow, (chiefly of men), from Ganjám to Burma, from Tanjore to the Straits, from Tinnevely and Madura to Ceylon.

26. In the fact that these eight districts very largely coincide with the "famine zone" of the Presidency, the true explanation will, I believe, be found. It is, I am aware, a generally accepted theory that women are less susceptible than men to the effects of famine; the observable mortality due directly to this cause may be smaller among them than amongst men, but, as to their greater power of resistance to privation generally, I think that there are grounds for doubt. A woman doubtless needs less food than a man, when both can get enough; but, when both are on the verge of starvation, the advantage in staying power is probably on the side of the man. If both are in receipt of non-gratuitous famine relief, the woman's task is lighter than the man's; but when both are endeavouring unaided to last through a bad time, the man has rest, for there is practically nothing for him to do; the woman cannot, (and will not), escape from the care of children, the cooking of such little food as may be procurable, and other household duties.

27. Belief in this explanation is strengthened by observation of certain changes in sex ratio. At the census of 1901 the men of Kistna outnumbered the women in the ratio of 1000 : 976. With the formation of the new Guntúr district the sex ratio changed, women now standing to men in Kistna as 1008 : 1000; the district redistribution taking away from Kistna the barren taluks of Narasaraopet, Sattenapalle, Palnád and Vinukonda.

28. Again in 1901 North Arcot was a "female" district with 1,006 women to every 1,000 men; but in this district the female predominance was entirely among the Tamils; in the Telugu section, which in point of absolute numbers was almost equal to the Tamil, men predominated. This difference was due, I believe, not to any racial peculiarity, but to the fact that the then Telugu portion of North Arcot was extremely liable to famine; it has now been absorbed in the new district of Chittoor where, as already seen, men are in excess.

29. Facts never run exactly as one would wish them to do, and it must be admitted that facts, on which this argument is based, do not afford an exception to the rule. Certain taluks of the new Kistna district such as Bezváda, Divi and Gudiváda, which cannot be regarded as famine zones, still show a male preponderance; in Guntúr men still exceed women in Bápatla taluk, and are outnumbered by them in Palnád; in Kurnool the Nandyál and Nandikótkúr taluks with a certain extent of irrigation are comparatively prosperous; in the first the numbers of men and women are equal, in the second men outnumber women; in Kurnool taluk men predominate, while in Sirvel and Cumbum women are in the majority.

30. But these eight districts have received perhaps more than their proper share of attention: to some points of more general interest allusion may be made before the chapter closes.

31. Subsidiary table IV, which shows the number of females per 1,000 males for certain selected castes, is an obviously unsatisfactory production. It is founded on the absolute figures of Imperial table XIV, which deals with the civil condition of these castes; and, as these figures were taken only from certain selected districts, their utilization for a different purpose does not fairly represent conditions existing throughout the entire Presidency. As a supplement I have prepared subsidiary table IV (*a*) founded on Imperial table XIII, which gives a more just view of sex ratio according to caste, tribe, and creed. The table is its own explanation, and affords support to the theory that preponderance of females is the natural condition of the Presidency; its figures may be examined in comparison with those of appendix I, in order to ascertain how far an excess or deficiency of females noticed in particular castes (*e.g.* Kómatis, Kápus, Mádigas) in particular districts represents or misrepresents general conditions.

32. Subsidiary table III exhibits sex proportion in the different natural divisions and religions in accordance with age periods. Its most interesting features are the confirmation it affords of the theory as to misstatement of female age at the period 10-15, and the curious local variations already noted, which are to be found in the more general proportions. The comparatively large proportion of women aged 15-30 in comparison with the number of the opposite sex at the same age would seem to be an effort of nature to make good the heavy female mortality at these ages noticed in subsidiary table VI.

CHAPTER VII.—CIVIL CONDITION.

MARRIAGE of some sort being the normal condition of the Southern Indian, and an unmated life being regarded as little less singular than would be a clothless existence in Europe, it is hardly necessary to apologize for regarding civil condition almost exclusively in its married aspect.

2. To the estate of matrimony a certain amount of indirect attention has been devoted elsewhere in this report. But in such references the marriages of the people were considered solely as ordained for the procreation of children, and as affecting the children sprung therefrom. It may be of some interest to view the matter from the standpoint of the contracting parties, rather than from that of their presumptive offspring.

3. In any consideration of the subject it is necessary to bear in mind the somewhat different connotations of the word "marriage" in the East and in the West. In Europe the word implies legal or religious sanction for a definite social relation, wherein the contracting parties are of marriageable, or better, cohabitable, age; it implies, moreover, an obligation on the part of the husband to support his wife, if she does not possess the means of supporting him. This obligation is scarcely implicit in India; nor has marriage a particular reference to age, except in so far as that among certain sections of the population it is looked upon as advisable, or necessary, to get one's female relatives married at an age that ensures for them the maximum possibility of physical disaster. For even if we grant that marriage in infancy *can* at most mean nothing more than irrevocable betrothal, it is not an unfair assumption that this infant betrothal leads to an undertaking of the real responsibilities of the married state at the earliest age that nature permits, and at one far earlier than nature, especially in the case of girls, renders advisable.

Religion.	Males.			Females.		
	Un-married.	Married.	Widow-ed.	Un-married.	Married.	Widow-ed.
All religions...	5,330	4,284	386	3,728	4,415	1,857
Hindu ...	5,284	4,322	394	3,662	4,446	1,892
Muhammadan.	5,821	3,876	303	4,123	4,132	1,745
Christian ...	5,606	4,071	323	4,457	4,114	1,429

4. The marginal statement, taken from subsidiary table III, shows the distribution of 10,000 of each sex by civil condition at the census of 1911.

5. Despite then the casual improvidence with which marriage is too often entered upon, the state of the Presidency is somewhat less married than one might expect. For these figures show that more than 50 per cent. of the male population are still in the enjoyment of single blessedness; while a rather larger number of women have at one time or another changed their state—a step which in their case generally denotes a final disposal of their chances in the matrimonial lottery.

6. Of material prudence or imprudence in marrying, the census enquiry affords no means of judgment. But an automatic check on amorous inclination is supplied by the age distribution of the people; although immature marriages may be

Distribution of 10,000 of each sex.

	All religions.		Hindu.		Muham- madan.		Christian.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
Non-marriage- able.	4,763	3,744	4,732	3,717	5,087	3,964	4,927	3,934
Marriageable.	5,237	6,256	5,268	6,283	4,913	6,036	5,073	6,066

frequent, their absolute number cannot, in the nature of things, compare with that of marriages wherein the parties are of suitable age. If we assume twenty years as the age limit within which a man should not marry, and 15 as a corresponding limit for girls, the appended figures show us

the marriageability of the people.

7. For the sake of greater convenience in comparison the two foregoing statements may be combined as follows :—

Distribution of 10,000 persons.	All religions.		Hindu.		Muhammadan.		Christian.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
Married or widowed ...	4,670	6,272	4,716	6,338	4,179	5,877	4,394	5,543
Of marriageable age ...	5,237	6,256	5,268	6,283	4,913	6,036	5,073	6,066

8. In addition to age there are sundry curious obstacles to a successful entrance on the married state: many a Hindu reaches the goal over a veritable steeple-chase course. But before attending to these matters, it will be well to examine in some further detail the question of age in relation to marriage, especially among the female sex. Of its urgency the records of any social conference afford ample proof.

9. The age limits for the respective sexes being as already assumed, the following figures show some considerable existence of premature marriage or widowhood :—

Year.	Males unmarried at 0-20 per 10,000.				Females unmarried at 0-15 per 10,000.			
	All religions.	Hindu.	Muham- madan.	Christian.	All religions.	Hindu.	Muham- madan.	Christian.
1911	9,592	9,566	9,814	9,822	9,034	8,960	9,523	9,707
1901	9,661	9,669	9,849	9,858	9,114	9,052	9,535	9,740
1891	9,596	9,577	9,816	9,792	8,996	8,939	9,458	9,624

Note.—For purposes of convenience, in this and in the succeeding statement, I give only the number of the un-married, from which the complementary number of those who are, or who have been, married may easily be deduced.

10. The question arises whether immature marriage is a tendency confined to one community of the people or spread among all; whether it is a tendency independent of the general marriage question, and one whose intensity may increase or diminish irrespective of an increasing or diminishing marriage rate; or else a custom so deeply ingrained that its fluctuations follow those of marriage in general. To these questions an examination of the position of 10,000 of each sex in the total population, and in each main religious community, with respect to marriage at the last three enumerations, appears to supply sufficient answer :—

Year.	Males unmarried.				Females unmarried.			
	All religions.	Hindu.	Muham- madan.	Christian.	All religions.	Hindu.	Muham- madan.	Christian.
1911	5,330	5,284	5,821	5,606	3,728	3,662	4,123	4,457
1901	5,524	5,484	5,983	5,838	3,897	3,835	4,281	4,623
1891	5,386	5,352	5,814	5,643	3,723	3,667	4,118	4,395

11. These figures, combined with those immediately preceding, indicate that immature marriage, while especially characteristic of the Hindu community, is yet a tendency diffused through other sections of the population; and at the same time one of such firm acceptance that its ratio varies well nigh exactly with the general frequency or infrequency of marriage.

12. It is not *prima facie* unfair to attribute the diffusion of this social tendency, as well as of many others, to Hindu influence. Hinduism comprises the vast majority of the inhabitants of the Presidency: the rival faiths of Islam and Christianity have either been recruited from its ranks, and have as yet not sloughed the heredity of centuries; or else, despite a measure of original independence, can scarce but assimilate the social influence of their mighty neighbour, which lives and moves and has its being in social regulation. In Hindunism then we may seek an explanation for the origin, if not for the continued existence of a phenomenon, which many of the most eminent among Hindus profess to deplore.

13. To the statement that premature marriage is in vogue among Hindus because the *shāstras* enjoin it no great attention need be paid: those qualified to speak on the subject express doubt as to whether the *shāstras*, read in the spirit rather than in the letter, contain any such positive injunction. Moreover it is permissible to question whether mankind has at any time followed a practice simply at the bidding of a writing, rather than evolved a writing from experimentally proved advisability. It has been well observed that "it is a too common practice "in this country, at once to ascribe to the mysterious influence of religion or caste "whatever may be hard to understand in the way of personal conduct; whereas "in many cases, an act that appears strange and unaccountable to a European is "done in obedience to a custom grounded on mere convenience."

14. The present conveniences of a system that burdens a boy with a wife long before he has any ability to support one, or that subjects a woman to the inevitable risks of maternity, long before Nature turns the balance of probability to the side of safety, are too successfully inapparent to render search for them a profitable adventure.

15. Adopting therefore another line of enquiry, some have found a reason for this practice in a supposed deep scepticism of the Indian as to female morality. This view does not lack a measure of support from the classics, and these, one fears, find a frequent echo in the every day utterances of many a worthy Indian citizen.

16. But if we are to measure the Hindu's estimation of his womenfolk by the utterance of dead and gone curmudgeons, it is only fair to remember that the same reproach strikes home to most other religions—certainly to Christianity. Whatever be the sum total of Christianity's work at the end of 1,900 years for her uplifting, there is no Sanskrit deprecation of woman that cannot be equalled, or excelled, by quotations from the Christian Fathers. Nor, on the other hand, is there lacking evidence to show that the woman of the Indian classics once enjoyed a freedom and estimation as great as any of her Western sisters.

17. Premature marriage, especially that of women, is generally regarded as characteristic of the Bráhmaṇ. The figures shown in column 27 of subsidiary table V lend little support to this view, save on the somewhat arbitrary hypothesis that certain sections of the non-Bráhmaṇ Hindu community, including those who profess to reject Bráhmaṇ authority, and those who, even to-day, can have little contact with, and are little influenced by, Bráhmaṇ precept and practice, have determinedly set themselves to imitate and to excel the Bráhmaṇ, in his failings rather than in his undoubted excellences.

18. More probable would seem the explanation of premature marriage which pays regard to the racial differences between the peoples now lumped together under one general head of religion, or the several, but still widely inclusive, sub-heads of language.

19. Whatever may or may not be his present degeneration, there can be little doubt that the Aryan forbear of the present day Bráhmaṇ stood for a civilization and morality infinitely higher than that of the Dravidian hordes, with which, even as a leader, he had to associate himself. From the curious students of such primitive societies we may infer that the marriage relation, not too complicated or stable in modern days, existed some centuries back as a natural simplicity, which cannot have failed to strike the more intelligent Aryan as undesirable in the extreme.

20. The premature marryings of the early Aryan we may then ascribe to two influences. First to his desire to safeguard the purity of his race, and the morality of his daughter, by securing for her a husband within her own community at the earliest possible moment; secondly to an imitation, albeit one unconscious and one much modified, of the promiscuous cohabitation which he saw about him. His reciprocal influence is shown in the permanency and sanctity which the tie has assumed among the more educated portions of the non-Bráhmaṇ community; his persistence in the needless custom of premature marriage, and his excelment therein by sundry of his imitators, can be attributed to the unintelligent application of a rule of which the purpose has been forgotten. Whereas among the primitive "Animistic" and "outcast" peoples, for whose social guidance Bráhmaṇ influence, good or bad, is practically non-existent, premature marriage is probably a lingering survival of old time promiscuity.

21. But whatever be its cause there can be little doubt of the wide prevalence of premature marriage. It may be well to consider its advantages and disadvantages in some detail. In doing so it must be remembered that it is futile to import into the word marriage, as applied to Indian facts, its European associations. The validity or propriety of a marriage is determined solely by the standards of the society to which the contracting parties belong. Thus "marriage" in Southern India may imply a relation in some respects much more rigid and unalterable, (as among Bráhmaṇs), than in Europe; on the other hand it may denote a state of things to European eyes in no way differing from mere animal promiscuity. In ethnographic writings I have seen at times the term "incestuous" applied to certain unions, (such as that between uncle and niece), existing in Southern India. The use of such a term is obviously improper; it might with equal justice or injustice be applied by a Hindu to many marriages absolutely unobjectionable in the eyes of European Christianity.

22. The advantages and disadvantages of a social relation have twofold application; they may be considered in regard to individuals, and to the society of which such individuals form a part. If marriage means simply promiscuous sexual freedom from an early age, with a certain quasi permanency when the natural results of such relationship become apparent, (such is the description of Chenchu marriage given to me by a correspondent), the ill effect of such a state of things on the physical and moral health of the individual, and of his society, are too obvious to need detailed description. Some detailed statements by competent observers will be found in those paragraphs of Chapter XI which treat of the Khonds and Tódas; the results appear to be, as regards the individual, the spread and transmission of loathsome disease; as regards society, in the latter case at all events, racial suicide. The extremely rigid Bráhmaṇ ideal of marriage, while, by its insistence on premature marriage in the case of girls, it in a sense safeguards female chastity, must necessarily involve certain individual and social evils. In respect to the individual woman the physical effects of early sexual intercourse and premature maternity, which in most cases are the natural *sequelæ* of immature marriage, are obvious; although theoretically immature marriage on the male side is not a necessary complement to that on the female, practically it must be so to a large extent; and the physical consequences though less apparent, can hardly be less regrettable.

23. In regard to society the harmful consequences of the system may fairly be summarized thus.

24. The physical and mental quality of a community made up to an increasing extent of the offspring of immature parents must necessarily deteriorate. The conclusion is not, I think, affected by the fact adduced by a Bráhmaṇ correspondent, that his community has in recent times produced, and will doubtless continue to produce, a certain number of men, (of the women it is impossible for an outsider to judge), who in natural intellectual endowment, and in subsequent attainment, take equal rank with the intellectual aristocracy of any nation. A swallow does not make a summer; that the rank and file of this particular community are

physically frail and undergrown is a fact which may be observed, and which has frequently been stated to me positively, if regretfully, by Bráhmans themselves.

25. With premature marriage the Bráhmans, and those who follow the Bráhmanical system, have in the case of women associated irrevocability; this in its turn involving, as a natural consequence, premature and sterile widowhood. From the figures of subsidiary table V we find that Tamil Bráhmans have some 482 widows not above 12 years of age; Telugu Bráhmans 1,848; Oriyá Bráhmans 657; and Kamsalas 2,286. Whatever may be said as to theoretical beauty of a marriage sacrament irrevocable even by the death of one of the parties thereto, (logically, it may be suggested, this irrevocability should apply equally to both sexes), the practical fact remains that these widows, who can never have been wives, represent potentialities of increase lost to the community.

26. Again the absolute necessity of premature girl marriage has given rise to an evil, which, if Indian writers on the subject are to be trusted, has grown to terrible dimensions in Hindu society where such ideals prevail. It being imperative on a father to get his daughter married before she reaches a particular age, he must literally do so at all costs. In other words, he must purchase a bridegroom. The social demoralization, which must necessarily result from the cold-blooded sale of bridegrooms by themselves or by their parents, has been described with Zolæsqe force by a recent Hindu novelist, who puts the following reflection into the mouth of one of his characters: "As for our caste customs and restrictions, can anything good ever come out of such as we now have? Why, if I go to a public prostitute's house for a night, I have to pay her handsomely, and put up with such treatment as she is pleased to accord me. But when a man offers me his virgin daughter, the apple of his eye, the very breath of his nostrils, a veritable gem of innocence and purity, the heiress of a thousand generations of chaste and loving mothers, to be my unconditional bond slave for life in implicit obedience and unswerving faith; to cook for me, wash for me, nurse me in my sickness, cheer me in my hopes, comfort me in my sorrow, rejoice with me in my happiness, love me for ever, for better and for worse, whether I hate her or return her love; to cherish and guard me like a second mother; to bear me pure and innocent children in infinite pain, and nourish and rear them up with infinite care and trouble to perpetuate my name; I must needs first impoverish and ruin her parents by extorting as much money as I can from them, and make them involuntarily curse the day when a daughter was born to them."

27. And the writer's grim descriptions of deceit and trickery arising from this practice; of a father allowing his daughter to sicken to death and forbidding aid, lest she might live unmarried through his inability to purchase her a bridegroom; of ill-matched unions, and life-long unhappiness, are endorsed by a prominent Indian journalist as "graphic and amusing (!) pictures of what obtains more or less generally in Bráhman households in Southern India."

28. Every question has two sides. As to the advantages of that premature "marriage," which is only another name for sexual promiscuity, I have indeed heard no argument. But in favour of the Bráhmanical system of premature marriage, I have heard from Bráhmans arguments far more convincing than the poetical rhapsodies, wherewith we are at times favoured by European sentimentalists.

29. Firstly this system, as suggested in paragraph 20 *supra*, safeguarded for those who adopted it the solidarity of their community, and the virtue of their women. But it may be questioned whether such safeguards are necessary at the present age of the world. Cultural and moral difference between many castes is now so slight that, sentiment apart, the possibility of intermarriage has in it nothing terrible; in an age of peace it is not complimentary to Indian womanhood to suggest that it needs protection from itself.

30. Secondly the Bráhmanical system, if it involves a possibility of premature and sterile widowhood, by its insistence on the necessity of marriage does away with the possibility of perpetual and sterile maidenhood, which exists in other countries. Every woman gets at least one chance in the matrimonial lottery; give

her two, and probably some other must go without any. And in fact, if age returns are approximately correct, (a doubtful point), the absolute number of these infant widows given in paragraph 25 *supra* is not very great.

31. Thirdly was used the argument that, if social bonds are once relaxed, liberty in India in this respect is apt to degenerate into license. By a curiously similar line of reasoning Browning's dialectical bishop defended his acquiescence in much of what he did not at heart approve.

32. It may, however, be observed that premature and regular marriage does not necessarily connote widowhood irrevocable if premature. In point of youthful marriages by far the most conspicuous are the Kálingis and Kalinjis, two sections of the community which were not distinguished in 1901. Among one large section of the Kálingis widow remarriage is permissible, in case the widow has no *male* children; among the Kalinjis widow remarriage is permitted, subject only to the curious qualification that the brother-in-law of the widow is entitled to the first offer of her hand. Among Telagas and Besthas, writes a correspondent, 95 per cent. of the girls are married before attaining puberty; Telagas permit widow marriage without restriction; Besthas allow remarriage of "virgin widows" and childless widows, but not of "divorced widows," or widows having offspring. And of course in the Muhammadan community, which shows a considerable proportion of early marriages and youthful widows, there is no objection to the remarriage of a widow.

33. The East, or that portion of it in which we live, moves slowly, and it is scarcely possible to draw from the figures of a few decades any conclusions as to whether theoretical declamation, of which there has been plenty, against the custom of premature marriage has to any appreciable extent materialized in practical result. Figures quoted in paragraph 10 *supra*, and the greater detail of subsidiary table I, suggest an improvement between 1891 and 1901, with a deterioration in the subsequent decade. But of this the true explanation is probably to be found in the economic characteristics, described in Chapter II of the two decades. The marriage of children, which is simply an occasion of expense to their parents, becomes naturally of less frequent occurrence at a time when such parents are hard put to it to maintain themselves; and when any avoidable expenditure, which under other circumstances inclination might dictate, must be eschewed. With returning agricultural prosperity an increase in the number of early marriages, if regrettable, is not a matter for surprise.

34. Moreover, though a little leaven leaveneth the whole lump, there must be some reasonable proportion between the amount of the leaven and the size of the lump for the results of the leavening process to become perceptible. The area over which reform has to spread is so wide, the numbers to be affected are so great, that it is hardly just to conclude that progress, because non-apparent, is non-existent.

35. In regard to the particular marriage customs and conditions of particular castes there is something to be said. Such peculiarities may be considered in two aspects; namely, conditions to be fulfilled, or obstacles to be surmounted, before marriage; and conditions under which marriage exists.

36. Of the first I may utilize for an example information given to me by a Bráhma friend. His information justifies the steeplechase metaphor employed in paragraph 8; * certain of the difficulties to be overcome are purely artificial, and, in one case at least, objectionable; others betoken a considerable foresight in avoidance of too close inbreeding which the universality of marriage might otherwise occasion.

37. Necessity of marriage, and difficulty of its accomplishment, being more urgent on the side of the bride than of the bridegroom, the business may first be viewed from the standpoint of a parent anxious to marry his daughter.

* The same idea has occurred to the Hindu novelist quoted at paragraph 26. He entitles one of his stories "Hymen's Obstacle Race."

38. (a) He must as a rule be prepared to pay the uttermost farthing that his means will admit, or that the bargaining ability of the bridegroom, or of his representative, can secure. On this evil business enlightened Hindu opinion, of which an example has already been quoted, is vocal: time will show if practice will follow theory.

(b) The girl must not have attained puberty.

(c) The horoscopes of bride and bridegroom must agree. This is a condition of fairly universal application; and in regard to it a Bellary correspondent gives me a curious piece of information. It is to the effect that in that district parents are unwilling to see a promising match broken off, because of an impediment as to the intrinsic validity of which a considerable degree of scepticism prevails. There has accordingly arisen a class of professional matchmakers, whose duty it is to pronounce on the agreement or disagreement of horoscopes, and whose statement is accepted as final. There are means of securing that it shall be as desired.

(d) The omens, which occur while "marriage business" is on the *tapis*, should be favourable.

(e) The husband should be older than his prospective bride—a requisite which has the weighty recommendation of Shakespeare in its favour.

(f) The husband must be of a different *gōtra* and *pravara* to his wife, and must not be within the prohibited degrees of relationship. From the first prohibition it follows that the bridegroom is unsuitable if related to the bride, however remotely, through the paternal male line. In respect of the latter a man may not marry his mother's sister's daughter; but a Dravidian influence is seen in the fact that he may now marry his mother's brother's daughter, although, strictly speaking, such union is contrary to *śāstraical* teaching.

(g) Bride and bridegroom must be of the same caste and sub-caste.

39. Such, my friend considers, are the matrimonial difficulties of his community stated in a succinct form. But inasmuch as for their full appreciation they presuppose a certain acquaintance with Brāhmanism and the religion of the philosophic Hindu, he amplifies his information in respect of caste and sub-caste. It will be found embodied in those paragraphs of Chapter XI, which treat more particularly of sub-caste formation.

40. There can be no doubt that many of these restrictions, utterly senseless now from a European point of view, were originally designed with the twofold object of preserving racial purity, and of preventing too close inbreeding; and in this quality were suited to the circumstances of those among whom they prevailed. But it would certainly appear that to-day attention is concentrated on the rules rather on their object, and that the whole system needs revision and adaptation to the needs of a modern community.

41. The fact that among Nambúdrī Brāhmins is found a large percentage of unmarried women at the ages 12–20, illustrates two peculiarities of their social system. The first is that women marry after attainment of puberty; the second that, inasmuch as only the eldest son of a Nambúdrī family marries in his own caste, the procuring of a husband is often a matter of the utmost difficulty for a father whose quiver has been filled with daughters. Possibly because of the temptations to which this difficulty gives rise, the Nambúdrīs possess a singularly efficient safeguard of morality, in their custom of outcasting all *men* implicated by a fallen woman, whose statement as to her lovers is considered conclusive. In a comparatively recent case a lady's victims numbered over sixty.

42. Inasmuch as the percentage of unmarried women *actat* 12–20 among Embrándrī Brāhmins, who are Canarese or Tulu immigrants to Malabar, is likewise high, it may be surmised that with their occasional usurpation of the term Nambúdrī, and imitation of the Nambúdrī custom of contracting sambandham with Náyar women, these Brāhmins have to a certain extent adopted Nambúdrī ideas with respect to the women of their own caste.

43. *Exogamy*.—Outside the Brāhman pale there arises the question of exogamous sept in relation to marriage. The existence of these septs has been noted by Thurston and other ethnological writers; a few castes among whose sub-sections

such are said to exist are the Udaiyáns, Vellálas, Kápus and Kómatís. But I have doubts as to whether this idea of exogamy presents itself as of any practical importance to the would-be benedick; *à propos* of the question a man rather aptly observed to me, "I have quite sufficient trouble in finding some one that I *can* marry, without bothering myself about those that I *cannot*." In other words such obstacles to marriage, where they exist, are as well known as *gotra* and *pravara* among Bráhmans, and probably were designed with the same object.

44. *Totemism*.—On the connection of exogamy with totemism, and on actual living belief in totemism, I have learned nothing except what has been already recorded by others. In fact there is no way of learning anything new on this obscure subject open to the superficial enquirer. As noted by Mr. Henderson in his remarks on the Gadabas, (Chapter XI), the jungle folk, among whom such ideas might be expected to prevail, are extremely shy about giving information as to their peculiarities to a stranger; to get to the bottom of their inmost thought and belief requires an acquaintance with, and a sojourn among them, which are out of the question for an ordinary official, especially if he be a foreigner. An Indian gentleman, who has studied the subject, tells me that totemism probably survives as a living faith in the inland tracts of the northern districts; and nearer the coast a tradition survives of there having been such a belief. But real information as opposed to hearsay, or to that style of information which the ordinary villager will give if he thinks that a particular answer will please his interrogator, my informant considers unprocurable; save by one who is prepared to remain for a considerable while in one locality, obtain a perfect command of the language of the people, live with them as one of themselves, and obtain his knowledge by observation, and hints here and there, rather than by direct question and answer.

45. In respect to the conditions under which marriage exists there are quaintnesses ascribed to sundry castes. It is however permissible to doubt whether such customs are not in many cases at the present day an affair of tradition, rather than of actual practice. The most striking illustration of such a state of things is the case of the Náyers, of whom Mr. W. Logan writes as follows: "The statement that the younger cadets of the Nambúdri families live with Náyar women, merely reproduces in English the Malayáli mode of describing the married life of these people, and of the Náyers. It is part of the theory that the women they live with are not wives, that they may part at will, that they may form new connections. The fact, at any rate of recent years, is that, although the theory of the law sanctions freedom in these relations, conjugal fidelity is very general. Nowhere is the marriage tie—albeit informal—more rigidly observed or respected, nowhere is it more jealously guarded, or its neglect more savagely avenged. Ceremonial, like other conventionalities, is an accident, and Náyar women are as chaste and faithful as their neighbours."

46. The proof of a pudding lies in the eating. Selecting certain castes as to whose matrimonial peculiarities statements are on record, I have tabulated their marriages by age periods in certain localities, in order to see whether theory is confirmed by statistical result. In respect of the Kallans, for example, I find the following statement made: "Marriage among the Kallans is said to depend entirely upon consanguinity. The most proper alliance is one between a man and the daughter of his father's sister; and if an individual has such a cousin he must marry her, whatever disparity there may be between their respective ages. A boy for example of fifteen must marry such a cousin, even if she be thirty or forty years old."

47. Tabulation of Kallan marriages in the Mélúr taluk of the Madura district gives the result noted in the margin. For 149 husbands aged 20 and under there are 680 wives of the same age, which implies that the husbands of such wives must be the elder. At the ultimate age period there is an excess of 1,476 husbands, which may be added

Age.	Males.	Females.
0-5	...	...
5-12	5	25
12-15	22	45
15-20	122	610
20-40	3,939	5,543
40 and over	3,182	1,706

to the number of husbands aged 20–40. At this age period alone wives will then exceed husbands of equal or greater age by 128 alone—a number too small on which to base any general inference.

48. Similar statements have been made in respect of the Kammas of the Tamil country, the Reddis (Kápus) settled in the Tinnevely district, and sundry other castes. Tabulation similar to that carried out for the Mélúr Kallaus,* has not in any case confirmed belief in the present reality of such practices, and gives rise to the impression that tradition of what may have happened long ago, combined with observation of a few abnormal cases, may be responsible for the attribution of peculiarities to people not differing particularly from the ordinary run of mankind in their marriage customs.

49. *Marriage of cousins.*—These statements, however, allude to a matrimonial practice, which, among the Dravidians of Southern India, is more widespread, and on the whole more deleterious, than the custom of premature marriage. This is the Dravidian *menarikam*, by which a man marries his mother's brother's daughter, his sister's daughter, or father's sister's daughter. The custom is not confined to any particular caste, or appreciably limited number of castes; and, as noted in paragraph 38, the system is creeping into Bráhmanism.

50. The ill-effects of consanguineous marriage in the transmission of infirmities have been emphasized by my medical informants in the several sections of Chapter X. The extraordinary difference between theory and practice in India was strikingly illustrated for me by conversation with some followers of the custom, who, from a theoretical standpoint, and from actual observation of results, appeared fully alive to the disadvantages involved in such close inbreeding. *Video meliora proboque, deteriora sequor.*

51. As the influence which induced continuance in a practice of which they disapproved, my informants gave the inevitable Indian answer—one hinted at in paragraphs 19 *et seq.* of Chapter VIII—the conservatism and prejudice of “the females.” In practical result, they also admitted, the custom kept the family together, and prevented dispersion of the family property. In this latter consideration is perhaps to be found the true explanation, suggested to me by Mr. F. J. Richards, of the system's origin. Assuming that among the Dravidian races inheritance passed in the female line, and that bequeathment from father to son was an innovation introduced by the conquering Aryans, this form of marriage represents or ensures an exact compromise between, or combination of, both systems.

52. There are other forms of cousin, or consanguineous, marriage. But all, I fancy, spring from the same idea, namely, the conservatism of property; and the general deleterious result is the same.

53. From subsidiary table IV we may learn the proportion of wives to husbands throughout the Presidency, in each of its natural divisions, and among the main religious communities of the people. Taken literally the figures suggest that on the whole polygamy is fairly frequent, and that it has increased in the Presidency in general and among Hindus in particular since the last enumeration.

54. That polygamy is possible among Hindus and Muhammadans is a well-known fact; that it should actually exist is what might be expected from the preponderance of women in the Presidency, combined with the universality of marriage. But that it is on the increase is a contradiction of human experience in general,† as well as of Indian testimony of the present day. Of these figures many general explanations can be adduced; the following may serve as examples.

55. Emigration is a factor which needs to be discounted. The proportion of wives to husbands is highest in the East Coast, northern and southern divisions,

* It was done for the Kammas of Tinnevely and Madura, the Káppilyans of Madura, the Kunnnavans of Madura, the Malayális of Salem, and the Tottiyans of Madura.

† The monogamic form of the sexual relation is manifestly the ultimate form, and any change to be anticipated must be in the direction of the completion and extension of it.—*Spencer.*

from which as noted in the chapters dealing with the movement of the people and with sex, there is a considerable seasonal outflow to Burma, the Straits Settlements, and Ceylon. The harvest labourer probably does not go to the expense of taking his women folk with him, unless he counts on their assistance in his work, or anticipates a long sojourn abroad. The proportion is lowest in the Agency and Deccan divisions, to which the idea of emigration is comparatively strange.

56. The vagueness of the term "married," and the difference of its Indian application to the sexes, needs consideration. It was frequently urged at classes held for census instruction that, while there was nothing strange or improper in designating a girl of *any* age as married, the term was absurd as applied to a boy of under (say) 12 years of age. *Per contra* it was argued that while a man might, if he preferred, remain unmarried, the idea of an old maid, at least among Hindus, was inconceivable. The argument was repeated to me by a Tamil Bráhmaṇ with particular reference to the statistics for his community; the existence of girls aged 20 and upwards, who had not through *some* form or semblance of marriage, he flatly denied.

57. In the case of irregular unions, which undoubtedly exist, it is probable that the woman almost invariably claims, for census purposes at least, the status of regular marriage. Among a certain widespread community, it was stated to me, by members of other communities it is true, married life without a concubine is not looked upon as exactly respectable. I have no means of verifying this curious assertion, and so merely record it; with the observation that, if it be founded on fact, the women concerned have probably returned themselves as married.

58. The figures shown against Muhammadans in the East Coast (South)

Number of wives per 1,000 husbands among
Muhammadans.

District.	1911.	1901.
Tanjore	1,367	1,400
Trichinopoly	1,130	1,074
Madura	1,082 }	1,372
Rámnád	1,528 }	
Tinnevelly	1,357	1,376

division are so curious that I have tabulated, as in the margin, the returns for each of the main districts comprised in that division. Allowing for the effect produced by territorial changes, the figures of 1911 and 1901 exhibit such similarity as to suggest that the information given to the enumerators has been correctly recorded. The figures of column 21 of subsidiary table II do not lend weight to the theory that marriage is more universal among the Muhammadan women of this division than elsewhere; although from column 3 of the same table it can be seen that the proportion of married men in the community is here lower than in other divisions, with the exception of the Agency division and the West Coast; in which latter division the proportion of married Muhammadan women is also at its lowest. The most probable explanation that I can suggest is that the Muhammadans of these districts are mainly represented by Labbais and Rávuṭtans, whose addiction to skin trade and general hawking leads them frequently away from home for the acquirement and disposal of their wares.

59. On the other hand, it may be that polygamy among Muhammadans is

Muhammadan women per 1,000 men in

Tanjore	1,297
Trichinopoly	1,084
Madura	1,060
Rámnád	1,403
Tinnevelly	1,251

really prevalent in these districts, and is necessitated by a large preponderance of Muhammadan women, which enumeration of the actual population shows as existing there. Still it may be noted that the disparity between husbands and wives is greater in each case than that between the sexes.

60. Actual and avowed polyandry is probably well nigh non-existent in the Presidency. Theoretically it may survive among many castes, as for example the Badagas of the Nilgiris, with whom the formal ceremony which enables a father to claim paternity of his child testifies to its one time existence; or among the Náyers of the West Coast; among low castes and aboriginal people the marriage tie may be exceedingly lax. But the claim of, and the co-habitation with, several husbands by

a woman is perhaps found only among the Tódas, whose women, so a missionary informs me, are beginning to awake to the physical and moral evil of the system. The awakening of such sentiment represents perhaps the only hope of survival for this luckless race.

61. In subsidiary table II will be found information as to marriage by sex, age, religion and locality. As in 1901, marriage among both sexes appear to be more common in the East Coast (North) division than elsewhere. Chapter IV shows this division to be pre-eminently Hindu in point of religion, and the weight of the Hindu figures exercises an influence in the general return. In point of early marriage of both sexes the division is conspicuous; that it should be so in respect of girl marriage is not surprising, when we recall the large proportion, noted in Chapter VI, which child wives bear to the total female population of the districts included in the division. A natural corollary of extensive infant marriage is a pre-eminence in point of child widows; those aged 10—15 number 18 per 1,000 as against the 10 per 1,000 of the Deccan; similar proportional figures for 1901 being 19 and 13.

62. The explanation usually given of this state of things is the greater

Civil condition of 1,000 women.

Age.	Kamsala.		Kammálan.	
	Married.	Widowed.	Married.	Widowed.
0—5 ...	13	...	1	...
5—12 ...	356	14	17	1
12—20...	804	112	430	11

orthodoxy of the Telugus, which finds expression in early marriage and widowhood. The classic comparison of Kammálans and Kamsalas is generally adduced in support; and on the present occasion this well tried friend is found reliable.

Kamsalas have 484 per 1,000 of their men married as against the 411 of the Kammálans; at the age periods 5—12, and 12—20, among the male sex Kamsala figures are 29 and 264, against the 7 and 54 of the Kammálans. The return for the gentler sex is still more conclusive. At all age periods together there are 473 Kamsala women per 1,000 married, and 272 widowed, for every 421 and 172 Kammálans. The comparison of early wifehood and widowhood I give in the margin.

63. It may however be noticed that widowhood at the ultimate age period among men is by no means as common among the men of this East Coast (North) division as elsewhere. This fact may be a testimony to the eternal optimism of the north coast man, but it is worthy of remark that his womenkind show a somewhat similar statistical tendency. There are 137 widows per 1,000 women aged 15—40 in this division; a smaller proportion than in the Deccan and on the West Coast, where the numbers are 149 and 147; at the ultimate age period there are 649 and 657 women per 1,000 widowed in the Deccan and West Coast, as against 620 in the North-East Coast.

64. These figures may betoken a considerable possibility of widow marriage in the orthodox north; but, on the other hand, they may suggest that orthodoxy presses so hardly on the widow as to hurry her promptly into the next world.

65. Why in point of elderly widowers, (40 and over), the Deccan should predominate is not exactly easy to see; unless it be due to the fact, seen in subsidiary table II to chapter V, that proportionately there are more men of this age in the Deccan than elsewhere. The number of women and widows at this age is also high: it may be a possible conclusion that the elderly people of both sexes in this harsh climate represent the survival of the fittest, and that the odds proportionately lengthen against the simultaneous survival of both parties to a union. In 1901 widows aged 40 and over were proportionately most numerous in the Deccan; the preponderance is now observable on the West Coast. The number of men and women at this age in the division has increased, but, disregarding the Agency division, it is lower on the West Coast than elsewhere.

66. The marriage ceremonies of particular peoples, castes, and tribes have frequently been described. Among the Goomsur Khonds, it is interesting to note,

the ceremonial followed suggests a survival of the idea of marriage by capture. The West Coast system, according to which among many castes a girl goes through a form of marriage with a man who is not to be her husband, is well known; as is the practice of formally marrying (by tying of a tali) a girl who dies unmarried.

67. Fictitious marriages are not unknown. A girl may marry an arrow, or tree, perhaps to escape the reproach of attaining puberty unmarried; she may marry an idol, which generally implies that she becomes a prostitute. Among some classes a man's third marriage is considered unlucky; he accordingly espouses a tree on which ill-fortune may vent its rage, and proceeds undismayed to his fourth marriage. It is customary that children in a family should be married in the order of their birth; should deformity or disease stand in the way, the road is cleared for the expectant younger brother by the marriage of his suffering senior to a plantain tree.

68. Recent legislative proposals may give some interest to a statement of the number of marriages contracted under the Indian Civil Marriage Act (Act III of 1872). The total number of such unions in the Presidency since the passing of the Act is 54; of these 46 took place between 1902 and 1911.

CHAPTER VIII.—EDUCATION.

STATISTICS procured by the census enquiry are generally deemed to afford occasion for a Jeremiah-like wailing over the educational lack of the Indian, tempered at intervals with consoling reflections as to progress made.

2. If education be “the systematic instruction, schooling or training, given to the young in preparation for the work of life,” it is scarcely just to draw conclusions, flattering or otherwise, as to the education of 42 million souls from the hasty enquiry of a single night as to how many people can write a letter and read the reply to it. For such was the criterion of education adopted at the present census. In other words literacy and education are not always convertible terms.

3. Reading and writing are so widespread in the West, and afford such a ready *means* towards education, that we may now take it as an axiom that an educated European can read and write. Hence we infer, somewhat illogically, that his education is the result of his reading and writing, and overlook the possibility of its attainment by other means. Yet reflection suggests that there are many whose literacy merely enables them to read rubbish, and occasionally write it; and whose education—the training of the mind that enables them to give a decent account of themselves in the battle of life—has been won in other ways. A recent writer on Agricultural Education has pointed out that the working farmer—on the whole a solid, thoughtful sort of man—is best reached, even in Europe, by oral exposition;

Occupation.	Population dealt with.	Literates.	Literates per 1,000.
Cultivating landowner.	973,196	153,343	158
Cultivating tenant ...	266,765	38,546	144
Farm labourer ...	543,192	11,901	22

his mechanical power of reading is not sufficient to let him deal with the meaning behind the written symbols. Cardinal Antonelli said of the Roman mob that, despite their illiteracy, their artistic judgment as a rule agreed admirably with cultivated opinion. The Madras agriculturist, the backbone of

his country, and no fool at his calling, a few typical figures show as generally illiterate.

4. Turning to table VIII we find that 3,130,250 of the 41,870,160 persons in the Presidency now satisfy, or profess to satisfy, the test of literacy. Comparison with the figures of 1891 is hardly possible, for at that enumeration to the literates was added a heterogeneous class of “learners,” among whom the student for his M.A. degree, and the infant biting his paws over the alphabet, ranked alike; while the Presidency total included figures for Travancore and Cochin. Compared with those of 1901 these figures show an absolute increase of 693,046 literates, or a proportional increase of 17·9 per mille, in relation to the total population.

5. Or, to sum up the matter briefly, the general population has increased by 83 per mille during the past decade. Separating the literate sheep from the illiterate goats, we find that the former have increased and multiplied at the rate of 284 per mille, the latter at but one quarter of this rate.

6. But only 75 per thousand of the people, 138 men and 13 women per thousand of each sex, can read and write in the year of grace 1911.

7. Granting, as we have done, that a profession such as agriculture, subject to disturbing influences which man cannot control, contains in its daily exercise certain educative possibilities, yet here, as in more stereotyped occupations, the general standard of intelligence is not so high as to render superfluous some additional measure of mental training. The most obvious direction in which such might be sought is that of literary education; but before we denounce the Indian donkey for lack of zeal in his pursuit of the educational carrot, it is only fair to consider the carrot's quality.

8. Much of the primary education now offered is undoubtedly bad ; mere rote work taught to children by incompetent underpaid men. An interesting light was thrown on this subject by enquiries made as to the every-day avocations of men temporarily employed in the census office. Though literate, most of these people could not by any stretch of the imagination be described as educated ; and between sudden demands for cheap clerical labour they find strange and casual livings. Prominent among such casualties is pedagogy ; the perpetuation of a vicious system by its products.

9. Moreover, in Southern India the path to literacy is beset with certain obstacles, which exist but in a very modified form in European countries. The fundamental difficulty inherent in the complicated and varying scripts of the Dravidian languages is even now recognized directly in the search for a simplified and universal alphabet, and perhaps indirectly in the spread of English education. The difficulty experienced in obtaining a translation of the census rules intelligible to the ordinary run of mankind, suggests that the peculiar syntactical construction of these languages, aided, it is true, by the pedantic convention which esteems literary style in Tamil or Telugu by its measure of Sanskritic unintelligibility, renders it scarcely less difficult for the "plain common Indian" than for the foreigner, to express, or understand in print, those shades of meaning, which in conversation, gesture and intonation supply.

10. There are certain further standpoints from which it is well to examine these figures. Such are religion, sex, and age.

11. Although there is no necessary connection between education and a particular form of theology, it is not surprising that the proportion of literate Christians should compare very favourably with similar returns for other religions. The proportion of 226 male literates per mille among Christians is exceeded by that of 463 per mille among the Jains ; but then the Jain community of the Presidency is so exceedingly small as to forbid the drawing of general inferences as to their educational position. Christians include among their ranks, it is true, a considerable number (32,048) of ready-made literates, Europeans and Anglo-Indians, but the true explanation of their pre-eminence in education is probably to be found in the spirit in which instruction is given.

12. The old time teacher of India—I have met a few survivors—taught chiefly because he liked teaching and talking. His methods may have been odd, but he followed them because he believed in them ; not because they were laid down by a code, and supervised by an inspector. Direct material return he expected neither for himself nor for his pupils : hence he was favoured in his disciples, for those who stayed with him were presumably of the true student type, and sought learning even at the cost of material loss. The method of the modern lay teacher is too often but accurate and mechanical obedience to a prescribed routine, on which he bestows neither considered approval nor disapproval. His efforts are directed, not so much to improving generally the mind and *morale* of his students, as to loading them up with answers to questions, to be discharged on some stated occasions with direct or prospective pecuniary advantage—and then forgotten. To some extent this may explain the curious discrepancy between the liberal theory and conservative practice of present day India. The high caste boy of an older day learned his superiority to the rest of mankind, and acted on such learning : his modern descendant learns the equality of all men, but learns with a view to a telling phrase in the examination hall or debating theatre, rather than to the practical ordering of his life.

13. No one will assert that the gaze of the educational missionary is entirely diverted from the possibility of worldly result : "he catches children with the bait of a good education, offering to the capable a hope of lucrative place and employment ;" but at bottom his secular teaching is but a means to the altering of his flock's whole life scheme. He offers education as part of a systematic cultural plan ; State schools offer reading and writing raw.

Literacy per mille.

14. The marginal statement bears out this contention. It shows that, as compared with the total population, and with the followers of Hinduism and Muhammadanism, the Christians have maintained and improved on the advantage with which they started at the commencement of the decade.

15. At the same time a certain reserve is necessary in the appreciation of these figures and arguments. A small well-defined community, other circumstances being alike, favours educational progress much more than one amorphous and unwieldy: the point is illustrated by figures relating to the Jain community quoted

Population.	Total.	Males.	Females.
Jains.	27,005	14,166	12,839
Literates per mille.	257	463	29

in the margin. The Christian and Muhammadan communities bear to that of Hinduism the proportion of but 32, and 72 per mille, respectively. Moreover the acceptance of Christianity is now practically tantamount to the placing of

oneself within the reach of education; so much does secular instruction form part of the Christian missionary's scheme of things.

16. Despite its great past, one scarcely sees such intimate connection nowadays between education and the faith of Islam; but at the same time that faith, far more than Hinduism, is wont to urge on its followers the small tincture of letters needed to decipher its sacred writings.

17. Furthermore the Christian and Muhammadan communities, despite internal sectarian differences, are, as a whole, well defined. Hinduism, as suggested in Chapter IV, is a term applied by European theological use to the beliefs of various peoples, who neither definitely repudiate one indefinite creed, nor accept any one of certain others more precise and fixed. Philosophic Hinduism has no need to be ashamed for the education of its followers; it is unfair to saddle it with responsibility for the educational shortcomings of heterogeneous multitudes,* whose chief claim to inclusion in the faith is that the wide tolerance of Hinduism has never definitely cast them out. And even accepting Hinduism as a whole, it is fair to recognize that this whole is in Southern India mainly rural and agricultural, and thus more independent of literacy than the Muhammadan community, which is rather urban and commercial.

18. I have said that small communities are more susceptible of education than large, other circumstances being alike. The qualification is necessary, and will explain the shortcomings of the Animists, whose poor literary case is exhibited in the margin. The term "Animist" has no particular theological meaning, and is but the label affixed to certain wandering tribes of the plains, and to the aborigines of the hills. The roving life of the former

<i>Literates per mille.</i>		
Total.	Male.	Female.
2	4	0.1

precludes school attendance; an obstacle to the education of the latter, though but one among many, is found in the fact that their languages possess no script of their own, and are, as a rule, not well suited by the script of their more civilized neighbours.

19. *Sex.*—It may not be incorrect to say that for the general welfare of Southern India in the present day progress in female, rather than in male education is significant and important. The exceeding bitter cry of the modern social reformer is ever that his struggle towards the light is hampered by the dead weight of

* Thus an early Christian writer—"The Bráhmans at the instigation of the devil, whose ministers they are, keep before the eyes of the masses a veil of superstition and ignorance, and thus secure themselves an easy living." A kindly apostle of the same school explains the success of Christian missionaries of a different sect as due "to the aid of the devil to whom they and their converts already belong."

female superstition and ignorance, that he can neither break from, nor drag with him; if a foreigner is chary of such wholesale condemnation, it cannot but strike him as curious that those who vaunt the position of the Indian woman, are wont to measure her influence by her power to place obstacles in the path of progress.

20. The propriety of making literacy the sole test of education has already been questioned. It would be a monstrous error to write down Indian womanhood as uneducated because illiterate; but it is a fair query whether illiteracy among women is not more likely to connote non-education than amongst men; and whether the effects of such illiteracy, when it exists, are not more marked and more disastrous among the higher classes than among the lower; among the well-to-do rather than among the very poor.

21. If a man does not or cannot sharpen his wits on the "three R's," he can do so to some extent in the following of his daily avocation; the smith must hammer his iron with due featness, the witness in large practice must vigilantly avoid a mixing of his facts. But a woman's part in her husband's avocation is at best small; and the higher her social rank, and the easier her worldly circumstances, the smaller it becomes. The syce's wife may have a working knowledge of how to handle and care for animals, the small farmer's better-half is to a considerable degree a practical agriculturist. But it is hard to estimate the mental opacity of the rich man's wife, to whom orthodoxy forbids reading, and whom wealth, or so called dignity, absolves from household cares and economies.

22. An addition to the community of 104 thousand literate women, of whom 37 thousand, now at the age period 10-20, will be the mothers of the coming generation, represents real step forward.

23. On this ascertained increase in female literates, rather than on statistics as to the number* of girls now under instruction, hopes for the next decade must be based. For though a spirit of enlightenment is abroad, there will arise a plagny doubt as to the reality of these school returns. One cannot help a suspicion that in many a case a daughter appears in a school return merely as an advertisement of the liberalism of her parent. Sent an infant to the school, as to a *crèche*, she is removed at the age of 9 or 10, before she can possibly have learned anything.

24. Viewed by religions, and in relation to the total population, literate women of all religions have increased by 5 per mille, Hindu women by a similar proportion, Muhammadan by 3, and Christian by 32 per mille. As regards the total religious community, it is true that so far only Christian literate women are of appreciable account; they number 106 per mille in contrast to the 11 per mille of Hinduism and Muhammadanism. But, placing literates and illiterates in separate classes, we see that progress is being made where it most was needed. Female literates in general have increased at the rate of 577, as against their illiterate sisters' rate of 81 per mille; similar proportional figures for Hinduism are 681 and 79, for Muhammadanism 393 and 107, for Christianity 355 and 142.

25. It is in some degree possible to estimate the vitality of literary education by the division of literates by age periods. The children of 0-10 at the present enumeration will be the adolescents of 10-20 in 1921; the college students of to-day will be the *grihasthas* of ten years hence. True education ends for man with the end of all things, but, as already explained, for our present purposes a more modest connotation of the word must needs suffice.

* Number of female scholars according to the Report of the Director of Public Instruction for 1910-1911.

	Total	207,932	In Training schools	...	...	404
In Arts colleges	...	32	„ Other special schools	...	...	891
„ Professional colleges	...	11	Private institutions { Advanced	...	...	500
„ Secondary schools	...	33,496	{ Elementary	...	...	16,571
„ Primary schools	...	156,027				

26. We would naturally expect the proportion of literates per mille at the period "20 and over" to be greater than such proportions at the earlier age-periods. But if the proportionate increase at the final age-period exceeds that of the earlier periods, it is a sign that an uneducated generation is growing up.

27. Happily every indication is in the other direction. The figures noted in the margin show that the younger generation are more than holding their own, especially in the Hindu and Christian communities. Even in the case of Muhammadans it is not an unfair supposition that a trading community may seek its education at a later age than those which supply recruits to the clerical and learned profession.

29. Statement B, it is true, hardly bears out our contention literally, but then if things are seldom quite so fair as one would wish them to be, here they are quite sufficiently fair to encourage the hope that they will yet be fairer.

30. Thus far education taken as but the equivalent of literacy. Progress in secondary, or higher education, is difficult to estimate: selection of *data* on which to found an examination is a matter on which no two persons are likely to agree. I shall take the recorded results of literacy in English, statistics supplied by the Registrar of Books, and those to be found in the University calendars for the decade.

31. There is nothing particularly meritorious in a knowledge of English *per se*: the weird reasoning of his northern fellow countryman occasionally casts up such knowledge as a reproach to the Madrasi. Still there would seem to be greater educational possibilities in a knowledge of two languages than of one; in Madras in particular, a knowledge of English affords opportunity for the commerce and interchange of ideas throughout the Presidency as a whole, as well as beyond its limits. The positive spread of this knowledge is not so far very great; it is claimed but by 66 per 10,000 of the total population; by 53 Hindu and 46 Muhammadans of a similar number. Christians, whose community includes many to whom English is the ordinary means of communication, naturally outstrip all other religions with 541 per 10,000. This department of education, as one would expect,

is almost entirely confined to one sex. Of some 19 million Hindu, and one and a half million Muhammadan women, but 3,770 and 194 respectively can read and write English. Among Christians, female literates in English number 23,124 out of a total of 613,280; but it must be admitted that the major portion of this total (14,152) belongs to the European and Anglo-Indian communities.

Nature of increase.	All religions	Hindu.	Muham- madan.	Chris- tian.
Absolute ...	84,784	67,222	4,828	12,469
Per mille ..	442	515	613	236

32. Proportional figures deduced from absolute figures, in which one term is exceedingly great or exceedingly small, are apt to prove misleading. The marginal statement shows the progress, both absolute and proportional, made during the decade in English literacy.

Age periods.	Increase per mille.			
	All religions	Hindu.	Muham- madan.	Chris- tian.
0-10 ...	-40	-29	404	-68
10-15 ...	178	246	360	15
15-20 ...	374	421	431	226
20 and over ...	525	598	697	309

33. Subsidiary table IV shows the present position of English education by age periods: the marginal statement shows the relation of these figures to those of 1901.

34. It is a permissible supposition that the proportional decrease at the first age period in all religions, and in each religion save Muhammadanism, is due to more accurate enumeration. The absolute figures in the case of Muhammadanism are so small, (an increase from 99 to 139), as to be negligible.

Class dealt with.	Increase per mille.			
	All religions	Hindu.	Muham- madan.	Chris- tian.
Literates ...	284	278	322	339
Literates in English.	412	515	613	236

35. A comparison of the progress of literacy in English with literacy in general may be exhibited for what it is worth.

36. The results of University examinations in 1911 are set forth in subsidiary table VIII, in a form which permits comparison with similar happenings ten and twenty years previously. There too progress is apparent, save, oddly enough, in the matter of B.L.'s.

37. Yet with no desire to disparage the success that has crowned honest endeavour, one may doubt whether such statistics be of much import, good or ill, for the due appreciation of South Indian educational life. Tacitly, if not expressly, the longer experience of western countries has accepted the ideal of educational value contained in the definition of a University as a place where young men can meet under modified control; where preparation for the examination is of greater value than in its passing. Free association and interminglement are as yet impossible in a land whose strange deifications some of her most famous sons have quaintly satirized; and the direct attachment of graduated pecuniary values to the passing of each and every examination, whether in public service—goal hitherto of all good graduates, where a man's adult capacity is measured largely by the academic success of his boyhood—or in the modern matrimonial market, cannot but depreciate the intrinsic worth of university laurels; while it endows them with a worthless worth as means to an end. Here too we may look for some explanation of the strange differentiation supposed hitherto to exist in modern India between the "educated" and the "upper" classes. Admirable as is the heroic self-sacrifice, through which a poor family sends its promising son to the University, it is too often but a curious placing out at interest of the family savings; the interest consisting in the obligation, faithfully recognized in most cases, on the

scholar to support his family on the monthly sale-proceeds of his University distinctions. The wealthy zamindar, under no necessity to provide for himself an old age pension, as yet hardly appreciates the value to his son, as an end in itself, of a University education.

38. It can hardly be argued that a great increase of published matter stands invariably for an improved intellectual activity; the tons of printed matter daily current in modern Europe do not necessarily denote, or coincide with, an era of spacious thought. But in Southern India the margin between scarcity and superfluity is still so wide that we may welcome the increase in publication shown by subsidiary table X as indicative of a growing public, to whom the art of reading is sufficiently familiar to render books and newspapers an agreement of life. We are far enough yet from the realization of the visions of the journalist, who saw, as in a glass darkly, Ramaswami leaning at even in intellectual contemplation on the five-barred gate of his paddy field, or deciphering the daily newspapers in the village smithy.

39. Education has been considered so far in relation to the Presidency as a whole, and to the main religions existing therein. Subsidiary tables II to VI afford material for some comment as to the position and progress of education in territorial divisions, and among the varying *strata* of the population represented by its several castes and tribes.

40. From our comparisons it may be as well to exclude Madras, Anjengo, and the Nilgiri Hills; the conditions existing in these three localities being somewhat different from those which obtain throughout the Presidency in general. Inasmuch as Anjengo and the Nilgiris are included in the West Coast division, we may discount the advantage in total literacy which subsidiary table II shows this division to possess; and assign pride of place to the East Coast southern territories, of which Tinnevely heads the list in point of male literacy, and takes second place to Malabar as regards the education of its womankind. Education in Tinnevely would appear to be in a healthily progressive state, inasmuch as the district, in addition to claiming for its men the educational place formerly occupied by those of Tanjore, shows in female literacy a considerably greater rate of increase than Malabar, and in point of English education is rapidly closing up the gap, which, at the last enumeration, separated it from Tanjore and Chingleput.

41. It is but in the nature of things that the Agency division, which in tabular arrangement is placed first, should in point of achievement occupy the last place. And for reasons already stated it is not surprising that its educational progress, even among men, should be represented by a figure less than one-third of that of its immediate superior, the Deccan. In this latter division the conditions of agricultural life are somewhat too strenuous to admit of literary dalliance; the marked paucity of scholars, both male and female, at the age of primary school-going (10-15), suggests that literary education has not as yet disclosed to the worthy householders of these stern regions a profitable field for the energies of their children.

42. If we divide the people, as Chapter IX shows that we may fairly do, into Tamils and Telugus, these subsidiary tables make it clear that educational advantage is entirely on the side of the Tamils. Yet bearing in mind the connotation, as yet artificial and unsatisfactory, of the word "education" to the present intelligence of the Madras *raiyat*, one hesitates to stigmatize as backward the second great section of the southern people, because of their apparent inappreciation of the arts of reading and writing. It is curious to note that well nigh one hundred years ago, when education as now understood in India was not, a keen observer * drew a cultural comparison between the Tamils and Telugus, much to the advantage of the latter.

* Monseigneur Bonnard—*vide* Chapter IV.

43. When we consider the obvious advantage in respect of educational facilities

City.	Number per 1,000 who are literate.	
	Male.	Female.
Madras	421	129
Kumbakonam	476	57
Calicut	352	112
Madura	412	50
Cocanada	266	71
Trichinopoly	433	86

possessed by a city as contrasted with the country, it is somewhat surprising that the Madras cities do not make a better showing in subsidiary table II. But, as already suggested in Chapter I, the term city is to a great extent a misnomer as applied in Madras, save to the capital; while figures quoted in the margin show that the general educational average of such cities as there are is utterly depreciated by lack of attention to the instruction of women. It is curious to find that Kumbakonam, generally regarded as an educational centre, and surpassing Madras city itself in regard to the education of its sons, should occupy last place but one among these six selected cities, if judged by its achievements in female literacy. The figures of Calicut and Cocanada indeed would almost suggest that male and female education enjoy a see-saw existence in relation to each other.

44. In a further paraphrase of statistics bearing on education by locality there is little genuine purpose. There is no general conclusion to be drawn, that the reader cannot draw for himself; no salient figure, that the trouble of turning a page will not give him.

45. Of more possible interest is the information in regard to the literacy of particular castes and tribes, which Imperial table IX and subsidiary table VI provide.

46. It is well to observe at the commencement that the proportional contrasts, which subsidiary table VI draws between our present table IX and its predecessor of ten years back, are apt to be misleading. In 1901 Imperial table IX showed the literacy of certain selected castes, and dealt only with those castes as found in particular districts. The table as now prepared classifies all the literates of the Presidency in accordance with the social or racial groups to which they belong. This result, more complete and satisfactory than that of old, I venture to think, is due to the ingenuity of Mr. S. Dandapani Aiyar, who pointed out an easy way to its accomplishment. To sort the slips of two million eight hundred thousand Palls to find 137 thousand literates would be a stupendous task, and one not worth the doing, if it had to be repeated for every caste and tribe of the Presidency. But inasmuch as the population *had* to be divided by caste and tribe, two objects could be accomplished at once by separating literates and illiterates generally for Imperial table VIII, and then sorting these two agglomerations separately for the purposes of table XIII. The sorting of the literate section provided table IX as it now stands; simple addition of literate to illiterate caste totals gave table XIII.

47. So much for the method. The main result, as subsidiary table VI shows, namely the general literary predominance of the Bráhmán, is what might have been expected. In point of female education, it is true, the Náýars are only excelled to any appreciable extent by the Bráhmáns of their own country, and their advantage over Canarese, Oriyá, and "other" Bráhmáns is very clearly marked. In the peculiar traditions, if not present practice, of Malabar womankind, we may find an explanation of the prejudice against female education, which still lingers in the orthodox Hindu mind; the point is accentuated by the comparatively high percentage of literacy (167, and 210 per mille) noticeable in the Bógam and Dási castes.

48. Educationally the Bráhmán is the leader of Southern India. In view of what "education" at present represents, it is permissible to consider whether the Bráhmán's pre-eminence is altogether to his unmixed advantage. The point was brought home to me one day, when walking with a meteorologist and a carpenter. The meteorologist was a Bráhmán, and an educated man: that is to say, having proved at certain examinations that he could speak and write indifferent English, he had thereby been enabled to follow a literary, or clerical profession, on a salary

entirely inadequate for the comfortable maintenance of himself and of his family. The carpenter, a Gallio in regard to education, followed a humbler walk of life with much more solid pecuniary advantage.

49. It is not every man's lot to go to Corinth ; nor, one fears, is the intellectual endowment of each and every Bráhma sufficient for the acquirement of a literary education, that will serve him as a sufficient pecuniary stay of life. Yet to a great extent the Bráhma, whose traditional priesthood is scarcely now a practical calling, has cut himself off from all professions, save those whose practice demands some tincture of literacy ; with the consequent result that he has overstocked his own market. And it is curious to notice how in this clerical market Indian opinion tends to regulate advancement by the passing of literary examinations to the disregard of practical ability ; and thus to forge chains for its own community.

50. Although for the ultimate progress of the country female education is of the last importance, and though, as already noted, the tender plant shows progress, yet for present purposes the number of educated women is too small to justify comparisons based on column 2 of subsidiary table VI. Confining our attention to column 3, we shall find that literacy is found chiefly among those sections of the people whose occupations render its possession of immediate use and advantage.

51. Thus the Kómatis, the great traders of the Presidency, have more than half their men literate, and, in comparison with other castes, show a respectable percentage of English literacy. Chettis—the term is somewhat vague—traders also, show 391 men per 1,000 as literate ; among artisans Kaikólans and Kammálans, with their Telugu brethren, the Kamsalas, occupy a fairly high position. It is worthy of remark that although the Tamil goldsmiths are popularly credited with greater liberalism and enlightenment than the Telugu, the latter have the advantage in female education, and in literacy in English. The connection of oil-pressing with education is not at once obvious to explain the culture of the Vániyans, whose educational champions, it is obvious, were somewhat ill chosen in 1901.

52. Among agriculturists, Kápus with 90 literates per 1,000 men compare unfavourably with the Tamil Vellálas. Vellála, it must be admitted, is a caste name of very wide comprehension ; and one by no means so closely associated with agriculture as Kápu. The Kammas are in better case, but still are far below the Bants of the West Coast (184 per 1,000).

53. Oriyá castes in general, with 103 male literates per 1,000, present a somewhat better appearance than I should have imagined, judging from the difficulty experienced in finding hands for the census abstraction office at Berhampur. It should, however, be remembered that for this office literacy in the Oriyá language was essential ; that the qualification is not widespread I infer from some small personal experience, from the fact that in 1901, when literacy by language was tabulated, Oriyá was not included in the list, and from the Superintendent of the Press, whom the lack of education amongst Oriyá criminals, or of criminal propensity amongst educated Oriyás much intrigues : the Oriyá convict cannot be used to supplement a deficiency of Oriyá compositors. If, indeed, Oriyá Bráhmans be excluded, the literacy of these Oriyá castes falls to 61 per 1,000 ; and Oriyá Bráhmans, it may be observed, occupy last place in the Bráhma educational scale.

54. The depressed brother figures poorly in educational matters. The Tamil Paraiyans, with 28 per 1,000 men literate, far outstrip such folk as Málas, Mádigas, Cherumans and Chakkiliyans—a result possibly in some measure attributable to their frequent employment in European domestic service, which so horrifies at times the Indian visitor. In an occupation not usually held in India social esteem—that of the barber—we find an appreciable percentage of literacy among the Tamil Ambattans, and the Telugu Mangalas ; Tíyans and Shánáns have now honourably extricated themselves from a once despised position, and a proof of their advancement may be seen in their education. Kallan progress may denote perception of the charm of honesty, or an adaptation of the people to the greater educational

needs of their hereditary profession in the twentieth century. The Maravan, whose attachment to his neighbours' cattle has been at time a subject of unfavourable comment, has made in ten years an appreciable educational advance.

55. Among Muhammadans, the Labbais, as one would expect from their addiction to trade, far outstrip their co-religionists in the literacy of their men; although they are below the general Muhammadan level in female literacy, and in literacy in English. Máppillas, the only other selected portion of the faith, follow at a respectful distance—a fact which may be explained by their greater addiction to agriculture than the majority of their fellow-believers.

56. Christian education has been treated at some length in the earlier portions of this chapter. Figures in subsidiary table VI are given for Indian Christians alone; as might be expected, deduction of the European and Anglo-Indian communities affects considerably the figures elsewhere quoted. But, considering the social class from which the Indian Christian community is largely recruited, their educational position and progress can hardly be deemed as other than creditable.

57. A footnote to subsidiary table I gives some particulars as to education amongst different Christian sects. The predominance of the Syrian Christians in general literacy, both male and female, coupled with their apparently infrequent acquisition of English, emphasizes the fact, already alluded to in Chapter IV, of their existence as an eastern church independent of European influence. It is curious to note that the Catholic church, which surpasses its western rivals in the education of its men, occupies a humble place in regard to female education. A possible explanation may be the greater success of the Roman church in conversion of the "high caste" population, among whom orthodox prejudice dies hard.

CHAPTER IX.—LANGUAGE.

THE enumeration schedules provide a column for entry of the language habitually used by each person enumerated. To write a chapter on the figures thus obtained, in comparison with those of previous enumerations, is as an attempt to remould ancient and crumbling bricks with a very scanty allowance of fresh straw.

2. Parts A, B and C of table X give us 28 Madras vernaculars, 18 vernaculars of other Indian provinces, 9 vernaculars of Asiatic countries beyond India, and 14 European languages as in daily use throughout the Presidency.

3. The figures in the margin show, however, that much of this detail is of little

Persons per 1,000 of the population speaking						
Tamil...	...	...	...	...	...	407
Telugu	...	...	...	...	...	377
Malayálam	...	...	...	...	...	74
Oriyá	...	...	...	...	...	38
Canarese	...	...	...	...	...	37
Hindústáni	...	...	...	...	...	23
Total						956

interest save for the curious student of linguistics, and of no importance in regard to practical administration. With a competent knowledge of *Tamil* and *Telugu* the foreigner can converse with 784 of every 1,000 persons that he is likely to meet: *Malayálam* and *Oriyá*, third and fourth in point of numerical importance, are confined each to parti-

cular areas; namely the two northern districts of Ganjáam and Vizagapatam, and the West Coast districts of Malabar and South Canara.

4. Of the remaining 44 per 1,000 persons, 9 and 4 are accounted for by *Khond* and *Savara*, and are only to be found in Ganjáam and Vizagapatam: *Tulu* speakers (12 per 1,000) are confined to South Canara, where, as may be seen in the margin,

Persons per 1,000 of South Canara population speaking						
Canarese	...	...	...	...	...	187
Tulu	...	...	...	...	...	428
Konkani	...	...	...	...	...	137
Malayálam	...	...	...	...	...	198

their speech commands far more adherents than *Canarese*, the official vernacular of the district. *Tulu* is, however, not a written language, although it has been written at times in the *Canarese* script; a fact which places it at an obvious

disadvantage as a vehicle for the transaction of business on any considerable scale. *English* is the mother-tongue of 39,309 of the population; a number slightly lower than that of the European and Anglo-Indian communities, which between them include 40,928 persons. But inasmuch as 2,868 persons have returned themselves as speaking European languages other than *English*, the conclusion to be drawn from these figures is that a certain number of Indians have entered *English* as the speech habitually employed by them. That such entry is correct in point of fact will be admitted by any one conversant with the life of the Presidency; while the assumption that all Anglo-Indians habitually use *English*, or any other European language, is one of very doubtful validity.

5. In regard to languages less important numerically, it is not unreasonable to suggest that many persons have imposed a tribal name on the language of which they speak a more or less corrupted version. Thus *Badaya* is as much *Canarese* as *American* or *Houndsditch* is *English*; *Irula* in *Tamil* peculiarized; *Konkani*, maltreated *Maráthi*; *Yerukala* or *Korava* is in practice, whatever it may be in theory, but a mish-mash of *Tamil* and *Telugu*; *Lambádi*, *Telugu* turned into thieves' patter. A philological surgeon dissecting these languages might possibly in course of time work his way down to something original and instructive; such feat has been accomplished in regard to *English Romany*. But for all practical purposes we may assume that the proportion now between original and borrowed is such that the latter completely obscures the former.

6. The possibility of a dialect being so strongly marked as to gain in time the standing of a distinct language is not strange, in view of the differences which manifest themselves in the usage of the same language in different parts of the country. Even to the hearing of a foreigner the *Tamil* of the Nilgiris differs widely from that

of Tanjore; understanding of the pure *Telugu* of Kistna by no means guarantees immediate comprehension of that spoken in Kurnool. A French writer, M. Jules Bloch, has written an article purporting to show that a competent knowledge of *Tamil* will enable the hearer to determine the caste of the person speaking. His observations as to the variation noticeable in the pronunciations of certain *Tamil* letters, for which there is no exact European equivalent, appear to be well founded; but as to the grounds to which he assigns this variation it is permissible to express a doubt. In any country it is comparatively easy for the native to draw from manner of speech certain broad inferences as to whether the person speaking is a schoolmaster or a scavenger, a banker or a bus driver; a Frenchman can probably distinguish without trouble a Marseillais from a Norman; it is not difficult for an Irishman to recognize the accent of Belfast as differing from that of Dublin, or the accent of Cork as different to either. But that caste in the abstract can have any distinguishing effect on speech is a theory which one may well question; the speech of a *Bráhmaṇ* certainly differs from that of a *Paraiyan*, but the difference is due not to an abstract theological relation of superiority and inferiority, but to the obvious fact that the present educational status and social surroundings of *Bráhmaṇ* and *Paraiyan* are markedly distinct. If an example of a difference, more subtle than that produced by the circumstances of every-day life be sought, it may be found in that trace of elaboration, or archaism, which as a rule distinguishes the language of an educated follower of the Vaishnavite form of Hinduism from that of a *Smárta*.

7. Certain further scepticisms arise tending towards a diminishing of the detail of table X. *Sanskrit* as the home language of 312 persons in Madras — *Credat Judæus Apella*. *Patnūli* or *Khatī* might possibly be clubbed with *Gujarāti*; it is a dialect of the latter spoken by the weavers of Rámnád, Madura and Salem, whose most distinctive feature at the present day is their extreme objection to be styled *Patnūlkárans*. *Persian* is not impossible in the case of some wandering gangs; but *Pársi* is probably a name used by aristocratic Muhammadans to distinguish their idiomatic *Hindóstáni* from the common speech of the market place.

8. Of the 25 districts into which, including Madras city as a district, the Presidency is divided, *Tamil* in 10, *Telugu* in 9, are the recognized vernaculars. *Canarese* and *Malayálam* are accredited to South Canara and Malabar respectively; in Chittoor and North Arcot *Telugu* and *Tamil* alike find place in the official list, as do *Telugu* and *Oriyá* in Ganjám. In Madras city alone is *Hindóstáni* recognized in divided prevalence with *Telugu* and *Tamil*.

9. This linguistic distribution is purely one of form and convenience; and there being no let or hindrance in any district to a person transacting his business with a Government official in whatever tongue he will, the administrative merits of the division are hardly open to question.

10. A question which is wont to arise at times is that as to the propriety of non-recognition of *Hindóstáni* as a vernacular of the Presidency. Statistical facts are against admission of the language, inasmuch as but 23 persons per 1,000 of the Presidency population return it as their vernacular; while in no district, other than Madras city, do the *Hindóstáni* speakers amount to 10 per cent. of the total population. But ability to speak a language is by no means coincident with its habitual use; and were enquiry directed rather towards ascertaining how many people in Madras can speak and understand *Hindóstáni*, the resultant figures would be widely different. Save perhaps in the agency tracts of Ganjám, Vizagapatam, and Gódávri, and, strangely enough, in the great Muhammadan stronghold of Malabar, there are few places where a tolerable knowledge of *Hindóstáni* will not enable the European to communicate with those about him, unaided by an English-speaking interpreter. More especially is this true of the Deccan division, in regard to which area I may illustrate the point from personal experience. In the Banganapalle State, situated between Kurnool and Cuddapah districts, statistics show 825 per 1,000 of the population as *Telugu* speakers, compared with 156 of the same number who habitually speak *Hindóstáni*. But *Hindóstáni* is certainly a possible and easy medium of communication in any village of the State; while in the capital, where doubtless the

presence of a Muhammadan ruler exercises an insensible influence, many *Telugu* Hindus use Hindóstáni in ordinary speech with one another.

11. While on the subject of Banganapalle, I may point to the curious entry of 24 *Oriyá* speakers shown as enumerated there. The schedule book was perfectly clear, but what these people could have been doing in Banganapalle remains a mystery. Possibly they were *Oriyá* vagrants; more probably they were wandering "Wudders" (earth diggers), who misled a careless enumerator by giving a tribe name, somewhat in sound resembling "*Oriyá*," to the language, most probably *Telugu*, spoken by them.

12. *Canarese*, as has already been seen, is hardly the representative vernacular of South Canara; *per contra*, if numbers afford any evidence, it would seem to have much stronger claims to official recognition in Bellary than has *Telugu*. The comparative paucity of *Canarese* speakers in Salem and Coimbatore, surprising to those with memories of these districts, is probably accounted for by their localization along the Mysore frontier.

13. The official division of Ganjám between *Telugu* and *Oriyá* does evident justice to both languages; the sharp distinction in respect of these languages between Vizagapatam and its agency tracts deserves a moment's notice.

14. So far as language is concerned the official distribution of other districts seems in the main to be correct. *Tamil* would appear somewhat flattered by recognition in Chittoor, as *Telugu* in North Arcot; but, as already suggested in connection with *Hindóstáni*, the currency of these languages in doubtful cases cannot be measured by the number of those who elect for one or the other as their habitual organ of speech. *Telugu* speakers are statistically few in Chingleput district; in fact the language will there be found almost as facile a method of communication as *Tamil*.

15. The questions of persistence and disappearance, or indeed of more or less extended usage, are hardly applicable to the main languages of the Presidency. *Tamil* and *Telugu* have increased, as must needs be the case, in point of absolute numbers, and in their proportion per 1,000 of the population; an absolute increase of 30,871 in *Canarese* has not sufficed to avoid a proportional fall of 2 per 1,000; *Malayálam* shows an increase of 1 per 1,000; but *Oriyá* speakers show an absolute decrease of 204,991, and a proportional fall of 8 when considered in relation to 1,000 of the population. This phenomenon is due to a decrease of 316,314 *Oriyá* speakers in Ganjám—a loss not counterbalanced by increases of 44,710, 696, and 64,483 in Ganjám Agency, Vizagapatam, and Vizagapatam Agency respectively.

Number per 1,000 of population who speak

Language.	1901.	1911.
<i>Oriyá</i>	755	512
<i>Telugu</i>	203	449

The proportional variation in the case of Ganjám is so remarkable as to suggest either careless enumeration at one census or the other; or else a possibility of deliberate mis-representation by *Telugu* or

Oriyá enumerators not uninfluenced by the contentions which prevailed some five or six years back between the *Telugus* and *Oriyás* of the district. The probability that the error lies in the earlier enumeration is strengthened by an examination as to the proportion of the district's Hindu population contributed by *Telugu* and *Oriyá* castes

Proportion per 1,000 of Ganjám population
who are of

	1901.	1911.
<i>Telugu</i> castes	486	453
<i>Oriyá</i> castes	473	262

respectively; of which examination the result may be seen in the margin. It is improbable that in 1901, when the *Telugu* castes were well nigh as strongly represented in Ganjám as the *Oriyá*, the disparity as to language in use should be so great.

In 1911 *Telugu* castes appear to have diminished somewhat in numerical importance, and *Oriyá* castes very markedly so. It should however be remembered that only main castes are now shown in detail against each district: in Part II of table XIII details are given for but ten *Oriyá* castes in Ganjám as against 75 in 1901.

16. In respect to other and less widely spread vernaculars there is not much of interest to be said. On *Gadaba* some remarks will be found in Chapter XI by

Mr. C. A. Henderson, I.C.S., who knows the people and their language. *Khond* and *Savara* are likely to persist with the persistence of the tribes from which the languages take their name. In the case of the former it is possible to notice a curious distinction, in point of vocabulary rather than of dialect, in the agency tracts of Ganjám. One speech passes current through practically the whole of the Goomsur-Udayagiri and Balliguda taluks; but the stranger, who wishes to converse with the *Khonds* of Rámagiri-Udayagiri, will need an extensive addition of synonyms to his vocabulary, almost every village having one or two words of purely local usage.

17. *Tóda* will assuredly come to an end with the disappearance of the *Tódas*—a contingency not altogether remote if the speculations of Chapter XI have any validity. The language of this people is interesting because incomprehensible; to one unacquainted with it it sounds not unlike the speech of buffaloes—a fact which may explain the sympathy between the *Tóda* and his herd. Practically all *Tódas* can speak *Tamil*, or the dialect of *Canarese* current on the Nilgiris; Sir Richard Burton, or one of his biographers, appears to have made the curious mistake of imagining that they speak *Telugu*. Missionaries, who work (with, I fear, scanty success) amongst the tribe, must needs have acquired the *Tóda* language to some considerable extent; yet curiously enough some *Tódas*, whom I questioned on the point, many years ago, it is true, stated positively to me that no stranger had ever learned their language sufficiently to converse in it without the supplement of *Tamil* or *Canarese* words.

18. *Mahl* is the language of Minicoy Island; the one *Mahl* speaker in South Canara was probably a chance fisherman or sailor, temporarily landed on the coast. *Kurumba* is merely the *Canarese* of a particular hill tribe, as *Koraga* is the Tulu of a “depressed class” in South Canara.

19. In regard to European languages other than *English* there is very little to be said. *Portuguese* is the language of the Portuguese-Indian half-caste, who has now become a statistical Anglo-Indian; in all probability it is claimed as mother-tongue by many whose acquaintance with it is but perfunctory. *French* speakers are largely missionaries, male and female—a class which accounts for many languages of the European continent spoken in the Presidency.

20. I cannot, I regret to say, claim for myself the credit of being the solitary male speaker of *Irish*.

21. Subsidiary table X to Chapter VIII shows us a marked increase in vernacular publications during the decade as compared with its predecessor. Allusion has already been made to certain inherent difficulties in the Madras vernaculars, which have probably, as much as anything else, hindered the diffusion of written matter among the masses. These difficulties are now being recognized in the search for a simpler style, but the general knowledge of *English* thought, and of the *English* language, among the literary class renders much modern *Tamil*—*Tamil* will serve for a present example—exceedingly difficult, if not impossible, of comprehension for the reader who knows no language save his own. The difficulty experienced by a European in acquiring a knowledge of *Tamil* does not lie solely in the acquisition of words, but rather in the fundamental difference of thought for which language is but a means of expression. Thus, as pointed out by that stern old purist Father Dubois, a simple English thought or expression, turned literally into simple *Tamil* or *Canarese*, may in its vernacular guise be utterly unintelligible, or, if at least intelligible, utterly absurd. Undoubtedly much vernacular writing of to-day is but *English* thought expressed through an unsuitable medium: the problem, which confronts the would-be popular writer in the vernaculars of Southern India, is to express himself without Sanskritic pedantry in the common speech of the people; and yet write “vernacular thought,” in place of transcribing perfunctorily into the vernacular the ideas which suggest themselves to him in English guise.

CHAPTER X.—INFIRMITIES.

It has been said somewhere by Carlyle that man can only see the evil which he has been taught to see. The statement is as applicable to physical evil as to moral evil.

2. As was the case with the census generally, enquiry into the matter of the unfit and the afflicted was carried through in one night by some three hundred and sixty thousand unpaid enumerators, the method employed being that of direct personal enquiry. The question of time and method apart, of these enumerators it may be said, without deprecation or ingratitude, that practically all lacked a tincture of that special knowledge requisite for satisfactory investigation of the prevalence or existence of certain obscure diseases; while few, if any, could be expected to bestow on the subject a degree of interest and reflection, which might enable a person of general speculative habit to atone in some small measure for technical shortcoming by ingenious use of mother wit.

3. It may then be granted that unqualified opinion, however honestly given, as to the existence of such maladies as leprosy or insanity, is of no scientific value. Doubt is practically dispelled by observation of the fact that of lepers selected, presumably by those deemed competent to do so, for examination by the Indian Leprosy Commission of 1890–91, well nigh 10 per cent. were found to be untainted by the disease. Again no man, however honest, will brand his most intimate relations as insane or leprous, while there remains in his mind the faintest glimmering of doubt or hope that his fears may be unfounded. In India is found an especial reason for denial in the stigma which attaches to an unmarried woman and to her parents—a fact which may partially explain a marked sex disproportion in the leprosy returns of the last three enumerations, and in the undoubted insanity of the Madras Asylum where, at a moment of enquiry, of 448 Indian patients but 89 were women.

4. This general explanation may perhaps be extended to cover the fact that, save in the case of blindness in 1891, men are found to contribute more to the ranks of the afflicted than women.

5. The instructions to enumerators threw on them the responsibility of deciding who was mad or leprous. Madness, as will be seen later in the opinion of an expert, is a relative term; and in India the rural lunatic must be very mad indeed before his antics attract the particular attention of his fellow countrymen. Leprosy is a disease of long incubation and slow progression, and, save in its marked forms, may escape the notice of the unlearned sufferer as well as of the casual observer.

6. With respect to blindness and deaf-mutism instructions were more precise. A person was not to be described as blind unless absolutely without sight; as deaf-mute unless entirely without speech or hearing.

7. A little reflection will show that precision in one of these cases defeats its own object. Unless the number of persons totally devoid of sight were very great, and this is not the case in Madras, it is difficult to see what useful purpose a knowledge of such number serves.

8. Total blindness may be, and often is, the result of accident; of more practical utility would it be to ascertain, if possible, the prevalent causes, other than accident or maltreatment, of impaired sight, and to suggest methods of remedy.

9. But while I deride others I myself become a castaway, if I essay my uninstructed comment on the material which the diligent, if unreflective, enumerator has provided. I have therefore asked and received expert aid towards the writing of

Lepers.

this chapter; and to Lieut.-Col. Elliot, I.M.S., Dr. T. M. Nair, Captain Heffernan, I.M.S., Dr. W. Stokes, Lieut.-Col. Leapingwell, I.M.S., and the Rev. D. Gioanini, I tender my best thanks for the help that they have afforded me.

10. To the knowledge of the following sections I can lay no claim : acknowledgment that I have in great part borrowed the phrasing of letters addressed to me personally is not intended as an attempt to saddle my contributors with responsibility for my own interpolations.

INSANITY.

11. There are reported to have been 8,407 insane persons in the Madras Presidency on the night of March 10, 1911; or, in round numbers, one in every 5,000 of the general population was mad. Sex distribution seen in subsidiary table I shows 24 males and 17 females per 100,000 of each sex as contributing to this total.

12. In the year 1901 the population of England and Wales was 32½ millions, of whom 132,654 persons, equivalent to one in 245 of the general population, were insane. If then our present census figures are to be accepted as they stand, the conclusion to be drawn is that insanity is some twenty times commoner in England than in Madras.

13. But granting that, owing to the greater stress of life in England, mental disease, and consequently insanity, is commoner there than here, the difference cannot possibly be so great as these figures suggest.

14. Of the insane in England in 1901 some 79 per cent. were under treatment in various institutions, and may therefore be regarded as undeniably mad. In Madras in 1911 only about 9 per cent. of those returned as insane were under regular surveillance, and the accommodation available would not shelter more than an additional 2 or 3 per cent. of the total number. There is therefore a possibility of excess in the untrained enumerator writing down as mad those who are not really so; but the probability is vastly greater that he deems many undeniable lunatics as afflicted by other conditions.

15. The present attitude of Southern India in relation to insanity is curiously akin to that which obtained in mediæval Europe. Persons suffering in Madras from melancholia are deemed afflicted with "the bile" rather than as insane; the sufferer from sundry other forms of mental disease is "bewitched" in Indian, and "spelled" in Anglo-Indian phraseology. In mediæval Europe the treatment of "*melancholia*," the black bile, much exercised the mind of the physician; bewitchment met with undeniable recognition in the frequent burning at the stake of witches.*

16. Mental affliction in the early Christian days of Europe provided a ready road to a local reputation for sainthood. Anchorites betook themselves to caves to escape the temptations of the world; they slept on beds of stone, and scourged themselves to "mortify the flesh;" unnatural ideals of virginity and celibacy, existent still, it is said, with similar effects in parts of Russia,† led to self mutilation. The visual hallucinations of such persons were regarded as veritable manifestations of God or Devil; their auditory hallucinations as the special revelation of God to His chosen few. All this is madness in Europe now; but in India the religious mendicant still wastes his life in "silent contemplation," sleeps on thorns, mutilates horribly the image in which he was made, and yet escapes remark in column 16 of the census schedule.

17. Thus, as suggested already, the explanation of the low percentage of insanity in the Presidency lies entirely in the relativity of the condition. Insanity is a social rather than a medical term, and the difference between sanity and

* The year 1891 is not so very remote. In that year, to the everlasting shame of their country and of those responsible for its enlightenment, a family in Southern Ireland burned to death one of its members, suspected of being "a fairy," but really insane.

† The sect of the "skoptzy."

insanity is largely a question of degree and environment. The point is illustrated by a comparison of the proportional figures of insanity among Bráhmans and among some other castes. There is no reason to suppose that Bráhmans suffer especially in this respect, but in their more cultured environment mental defect is more apparent, and more disconcerting, than among their less sophisticated neighbours.

18. In respect of the particular varieties of mental disease prevailing no information could be expected from the census returns. Four hundred and seven patients actually under professional treatment were classified as in the margin.

305 as suffering from maniacal conditions.		
30	"	melancholia.
14	"	mental stupor.
20	"	delusional insanity.
29	"	congenital mental defect.

19. But these figures cannot be taken to represent the true incidence of mental disease among the people. Melancholia, as already stated, is not generally regarded as a mental disease; the result of the well-known reluctance of the Indian to place his relations, especially female relations, under restraint is that only the worst and most unmanageable cases are sent to the asylum.

20. With regard to the causes of insanity, hereditary predisposition, in India as in Europe, seems to play an important part. It is intensified by the frequency of consanguineous marriage; contributory causes are also indulgence in ganja, and other preparations of Indian hemp; sexual excess during the immature and adolescent period of life; and, to a small, but appreciable extent, the abuse of alcohol.

It is a noteworthy fact that, during the decade 1901-1911, only in four cases admitted to the Madras Asylum could insanity be attributed to the abuse of opium, or its derivative morphine.

21. In the light of the foregoing remarks detailed criticism of the figures of tables XII and XII-A, and of the subsidiary tables concerned with insanity seems hardly necessary. The number of the insane has risen from 7,757 in 1891 to 8,407 in 1911; the increase as one would expect being somewhat more marked among males than among females. Subsidiary table I shows a slight proportional decrease since 1891 of insanity in both sexes in proportion to the total population; but statistics of insanity in the Agency can hardly be taken seriously, while the figures for the East Coast Central division are necessarily affected by the existence of the central asylum at Madras.

22. Muhammadans show a marked increase of insanity, as may be noted in the margin; but most remarkable or most unfortunate of all, at least according to statistics, are the Tamil Idaiyans, whose nursing has not turned on them a propitious eye during the decade. Their progress in infirmity is sufficiently remarkable to warrant detailed exposition: a probable explanation of their

Year.	Muhammadan insane.

DEAF-MUTISM.

23. There were 32,490 deaf-mutes enumerated in the Presidency in 1911, compared with 24,896 in 1901, and 27,398 in 1891. The proportion of the afflicted to the total population is 7·76 : 10,000 ; which corresponds exactly with the ratio usually accepted in Europe, where the Netherlands with 3·35, and Switzerland with 24·5 per 10,000, show the lowest and highest percentages respectively.

24. From the fact that the greatest number of deaf-mutes is found at the ages 5–10, and 10–15, it may be concluded that here too, as in the case of other infirmities, the returns are inaccurate. In deaf-mutism the predominating factor is deafness ; and accordingly deaf-mutes may be classified under three heads : (1) those who are born deaf ; (2) those who have become deaf after birth, and before acquiring the faculty of speech ; (3) those who have become deaf after imperfect acquirement of the faculty of speech. Parents are always unwilling to admit that a child is deaf and dumb ; the unwillingness is in a sense justifiable, as, even for an expert, it is not an easy matter to test the hearing power of an infant.

25. A child who becomes deaf during the first four years of its existence seldom acquires the faculty of articulate speech : should deafness come on between 4 and 7 years of age, much depends on the child's natural intelligence, and the intelligence and care of its parents and guardians. After the age of 7, save in exceptional cases, the power of speaking is generally preserved. Hence, there being no apparent reason for an accession of numbers at the period 10–15, we may infer that the correct number of deaf-mutes under 10 years of age has not been ascertained, and that the numbers given in the table are considerably below those which would be warranted by actual facts. The obtaining of a correct return Dr. Nair considers practically impossible.

26. The causes of congenital deaf-mutism are generally acknowledged to be (1) hereditary transmission, (2) consanguineous marriage. With respect to the first point 800 slips of male deaf-mutes, and 500 of females were examined ; with the result that, of these numbers, 264 men and 127 women were found to be married ; while the widowed of either sex were respectively 127 and 66.

27. In respect of consanguineous marriage, the peculiar caste system of India, as noted subsequently in the case of blindness, is undoubtedly responsible for a large number of such unions ; and Dr. Nair states that, of the large number of deaf-mutes that come under his observation, an appreciable percentage are actually the children of consanguineous marriages. Proportional figures such as those noted in the

<i>Proportion of deaf-mutes to 100,000 persons.</i>

margin, throw little further light on the question ; a particular conclusion from a general premiss, as observed later, is unwarranted. The marked preponderance among Telugu Brahmins is curious, but if taken as implying an especial habit of consanguineous marriage, it is in direct contradiction to the conclusion

which similar figures in respect of blindness seem to indicate.

28. In addition to the general prevalence of consanguineous marriage, there is another factor which may operate to the detriment of the people in this connection. This is the extraordinarily long period during which mothers suckle their children : it is not uncommon in the Presidency to see mothers suckling children nearly two years of age. The point was noticed in the case of Scotland by Dr. William Farr, who observed that “in those districts, viz., Highland and Insular, where mothers suckle their infants from 14 to 18 months, deaf-mutism and blindness prevail to a very much larger extent among the people than in districts where nine and ten months is the usual limit of the nursing period.”

29. Epilepsy and idiocy are not uncommonly associated with deaf-mutism in Madras ; and it is of some interest to note that in respect of multiple infirmity, insanity *plus* deaf-mutism largely predominates.

30. Among the most common causes of acquired deaf-mutism are typhoid and scarlet fever, small-pox, colds followed by local inflammation, scrofula, falls and blows. With the exception of scarlet fever such causes are very generally prevalent in Southern India.

BLINDNESS.

31. On the night of March 10th, 1911, there are said to have been in the Madras Presidency 33,982 persons totally devoid of sight. This absolute total represents 81 per 100,000 of the total population, and discloses a state of affliction, which does not compare unfavourably with that of other countries, for some of which figures, taken from the report of the Committee of the Formosan Special Census investigation, (Tokio, 1909), are quoted in the margin.

Persons blind per 100,000 of total population.

England	80
Ireland	110
France	80
Germany	90
Russia	190
Italy	90
Sweden	80
Bulgaria	310
United States of America	80
Canada	70
Australia	70

32. If the further figures noted at the side are to be accepted as reliable, the number of the blind in this Presidency has decreased steadily throughout the past twenty years. But in part I of table XII, which exhibits the age distribution of this infirmity, may be noticed certain points which afford a warning that the statistical basis of our deductions is not of the soundest.

Persons totally blind.

1911	33,982
1901	34,461
1891	36,853

33. In the first place a decrease of 2,392 from 1891 to 1901, and one of 479 during the succeeding decade, can largely be accounted for by decrease of 1,743 and 509 at the ultimate age periods examined (60 years and over). Hence we are led to suspect that the general decrease may be more apparent than real, and due to a more precise care by the enumerators not to enter as blindness the extreme dimness of old age.

34. Moreover we would naturally expect from cataract, and other diseases of old age, a steady increase of blindness up to about the period 55, and thereafter a steady decrease due to death. For the strange quinquennial increase and remission, which here characterises the later age periods, there is no apparent explanation. Misstatement of age may be suggested; with, at first sight, some measure of probability. But the peculiarly systematic misstatement that acceptance of this explanation implies is a somewhat arbitrary hypothesis; and one not rendered more credible by the fact that increase here is at the quinquennial periods, while the general tendency of the uninstructed Indian is to prefer the decennial periods when giving a general estimate of his age.

35. For purposes of convenience, the causes of blindness, as met with in the southern Presidency, may be classified as (1) the preventable, (2) those for which no prophylactic measures are available.

36. We may dismiss the latter class first, as they are of far less practical concern than the former. They are mainly of the congenital type, and include the various forms of infantile cataract, of microphthalmos, and of allied congenital defects. These defects seem to be much commoner in India than in Europe, and the true explanation is probably to be found in the intermarriage of relatives.

37. Such intermarriage is doubtless facilitated, despite certain countervailing restrictions, by the caste system which informs Southern India. Although it must be remembered that deduction from the general fact, that an individual belongs to a society wherein consanguineous marriage prevails, of the particular fact, that such individual is the child of a consanguineous marriage, is arbitrary rather than scientific, still the contrast of figures taken from table XII-A affords some confirmation and illustration of this theory.

38. Difference of speech and habit, aided by, or possibly arising from, the natural formation of the country, have isolated the West Coast community from the rest of the Presidency, and, combined with caste restriction, must needs have introduced a strong element of consanguinity into marriage. The blind, although *actually* most numerous on the East Coast, are shown by subsidiary table I to be far more numerous on the West Coast than elsewhere, in *proportion* to the total population. It is worthy of notice how this excess of infirmity runs throughout the various social *strata*. Among Malayalam Bráhmans 181 persons per 100,000 are blind, as compared with 96 among Tamil, and 66 among Telugu Bráhmans. Of Náyers 144 per 100,000 are blind; of the same number 53 Kápus, 72 Vellálans, 77 Kammálans, and 86 Kómatís are afflicted. The Tamil Paraiyans have 80 per 100,000 of their number blind; the Telugu Málas and Mádigas 62 and 85 respectively: on the West Coast 204 Cherumans and 101 Tiyans of every 100,000 are blind.

39. Among Indian Christians, a community whose circumstances must favour consanguineous marriages, 98 persons per 100,000 are blind. Inasmuch as similar circumstances probably exist among the Anglo-Indian community, the fact that of them but 31 per 100,000 are blind is striking; but may in a measure be explained by their presumed avoidance of much that produces blindness in the Indian. Yet although Muhammadans intermarry closely, and although among their ranks are found those whose diligence largely contributes to the blindness of the Presidency, their percentage of blindness, (80 per 100,000), is slightly lower than that of the total population, and by no means so high as that of many Hindu castes varying widely in social rank and custom.

40. Under irremediable causes too must be included the eye defects found in children of unhealthy parents, and especially amongst the syphilitic. In theory it may be urged that such causation is preventable, but for practical purposes such argument is at present futile. The question of state regulation of prostitution lies between, and it may well be centuries before this can be taken up seriously.

41. We now come to the preventable causes of blindness. In the order of importance first place is claimed by (*a*) neglected *Trachoma* (granular ophthalmia), which affects children and adults alike. A common cause of the spread of this disease is the custom of anointing the eyelids with various powders. Such powders are kept in a common cup, into which all members of the family, or at least all who use cosmetics, dip, and thus one affected member can affect a whole household. In this, as well as in the reason referred to in paragraph 3 *supra*, may be found the explanation of the fact that the infirmity of blindness is in Madras well nigh as widespread among women as amongst men; although in various ways the former can transmit this particular affection to the latter. Neglect, improper or insufficient treatment of this disease, leads to serious *sequelæ*; and in early neglect of the disease in children may be found the reason for the remarkable increase in blindness which occurs immediately after the age period 0-5.

42. (*b*) *Ophthalmia of new-born children*.—It has long been recognized in Western countries that this bulks there as one of the greatest factors in the production of preventable blindness. If such is the case where the midwives are certificated and trained European women, and where it is the rule rather than the exception to call in medical aid in all difficult and complicated cases, it is obvious how potent an influence for evil must be the native midwife, whose qualifications

Year.	Age period.	
	0-5.	5-10.
1911	938	1,631
1901	941	1,812
1891	1,322	2,016

and methods have already been described in Chapter II. Indian opinion appears to be waking to a consciousness of this evil, and a progressive diminution of blindness at the earliest age periods,

when age is not so much a matter of uncertainty or misstatement as in later life, may be due to a gradual amelioration of these conditions. A decrease at these early ages is indeed the most hopeful feature of the general decrease noted in the second paragraph of this section.

43. (c) *Cataract in all its forms.*—It is often asked “why is cataract so prevalent in India?” The question is based on the well-known fact that Anglo-Indian oculists have an unrivalled experience of this disease, and rank their cataract extractions by the thousand, against the hundreds or less of European surgeons. But while cataract may be more common in the East owing to glare and heat, the explanation of the whole matter is that trained ophthalmic surgeons in southern India are few in number, and this particular work being concentrated in a few hands, instead of being diffused through many, comes prominently into notice.* The population of the administrative county of London is about $4\frac{1}{2}$ millions; that of the Madras Presidency about 42 millions. London has three large eye hospitals, and in several of the general hospitals there are eye departments (about 20); Madras has one ophthalmic hospital situated in Madras city. There are many throughout the Presidency for whom resort to the city is out of the question; if the District Medical Officer lacks the training in this particular business that would enable him to seek and command the confidence of the timid shy people by whom he is surrounded, the blind lie in their homes untouched; or else resort to the Muhammadan cataract coucher, whose filthy ways and hopeless ignorance render his results appalling.

44. (d) *Neglect of the eyes during severe illnesses such as small-pox, typhoid, and many others.*—The patient lies for days semi-conscious, with eyes half closed. Dessicating winds blow on him, flies and dust settle on his eyes; no one thinks of protecting these delicate organs at a time when the patient's reflex protective powers are abolished or dormant. The result is corneal ulceration, with all its ghastly sequelæ; and another individual is thrown on his relations a hopeless burden, who might, with a little care, have taken a share in the life work of the community.

45. (e) *Improper treatment of the eyes at the hands of native “Vaidyans,” who resort largely to irritant drugs placed within the eyelids.*—In the majority of cases these remedies are intended as treatment for conditions, which, if left alone, would get well of themselves; and even in those cases where the *prognosis* is more grave, the treatment is far worse than the disease. The *Vaidyan* does not confine himself, in doing this damage, to cases of ophthalmic affection, but frequently inserts his dangerous pastes beneath the lids of patients in the comatose, or semicomatose state, of various severe diseases. The motive is restoration to consciousness; the end attained is too frequently the abolition of vision.

46. (f) On every occasion when an eclipse of the sun is visible in India, cases of “Eclipse blindness” are encountered shortly afterwards. The patient looks at the phenomenon, either with the naked eye, or through insufficiently protective glass. The solar light though greatly diminished in volume has lost nothing in intensity, and, focussed by the refractive media of the eye as by a burning glass on the retina, kills that delicate structure at its most important part—the very centre of vision. The victims are usually young people, whose career of usefulness is too often ended at a stroke. For one whose case comes under notice there must be hundreds never seen. Dissemination of information on this subject immediately before an eclipse would undoubtedly save many eyes.

47. This list of preventable causes may conclude with a few, against which common sense, as distinct from professional knowledge, would form a fairly efficient safeguard. Among these are the accidents caused by the explosion of crude native fire-works, made by mixing red sulphide of arsenic and chlorate of potash, and blending with the mixture rough sand or fine gravel. Such fire-works are often prepared for the amusement of children by their elders who ought to know better. Accidents from aerated water bottles might be avoided largely by covering the bottle before opening; a little care would largely diminish accidents from thorns in the jungle, from children's nails, etc., etc.

* Lieut.-Col. Elliot tells me that he has in one morning extracted 54 cataracts at the Madras Ophthalmic Hospital.

LEPROSY.

48. The table shows an increase of 3,280 lepers since the last enumeration : of

Year.	Lepers at age period 0-10.	
	Males.	Females.
1911	124	59
1901	54	47
1891	131	80

this number 2,458 are men and 822 women. The increase is most strongly marked at the later periods of life, male lepers aged 40-60 numbering 5,806 against 4,644 in 1901, and 4,123 in 1891 ; similar figures for females being 1,584, 1,259 and 1,203. Still a curious, and, if the returns be accurate, regrettable fact is the recrudescence of leprosy in early life, which the marginal figures suggest.

49. Reasons have already been given for doubt as to the general trustworthiness of figures relating to infirmity ; and information as to the prevalence or diminution of leprosy, and other ills, in particular districts, and among particular classes of the population, can be obtained from the various parts of table XII without need for further exposition here. It is, however, worthy of remark that one of my medical informants questions the apparent prevalence of leprosy among Paraiyans. In his experience, he states, he has met but two real lepers of this caste ; while he considers that on the West Coast leprosy is more prevalent among Máppillas, Tíyans and Náyers than the figures returned indicate.

50. The origin of leprosy is a question on which medical theories differ, and one on which it would be absurd for me to express an opinion. As to its continued existence certain causes suggested by the Rev. D. Gioanini, S.J., Superintendent of St. Joseph's Leper Asylum, Mangalore, and by others, appear adequate and convincing. They are as follows : (1) absence of segregation, which results in lepers, even in advanced stages of the disease, living in the midst of their families ; (2) employment of lepers in such businesses as milk-selling, cigarette-rolling, petty shop-keeping, etc. ; (3) marriage of persons, either suffering from the disease in its incipient state, or in whom the virus is latent ; (4) unrestricted circulation of coins and currency notes handled by lepers ; (5) unrestricted use of railway carriages by lepers. In respect to the possibility of arresting or stamping out the disease, all my informants agree in thinking that nothing can be done without legislation, which will place some restriction, at least in towns and cities, on the freedom of movement and occupation at present allowed to lepers.

51. In addition to the provision made for these unfortunates in the Leper Hospital at Madras, asylums are maintained by missionary bodies at various places throughout the Presidency. One asylum in Mangalore has been noticed already ; a letter from the Superintendent of a Mission to Lepers in India and the East, dated 1907, makes mention of homes at Calicut, Mangalore, Sálúr, Rámachandrapuram, and Bápatla, wherein the average numbers of inmates at that time were 45, 6, 30, 90 and 80 respectively.

52. There are some points of general interest in respect to the infirm generally, as well as to lepers in particular, which may here be examined. Such relate to birth-place, occupation, education and civil condition.

Tabulation of the birth-place returned by each and every sufferer shows clearly				
Infirmity.			Total number of infirm.	Number born in Madras city.
Leprosy	...	...	272	151
Blindness	...	...	175	114
Deaf-mutism	...	...	197	150
Insanity	...	...	625	267

of leprosy and insanity, is easily explained by the greater facilities for treatment there obtainable ; in the case of blindness and deaf-mutism, it may be accounted for by the hope of charity which a large city holds out.

53. In regard to the occupations of actual workers among lepers some gruesome information is available. Nearly 6,000 persons are engaged in cultivation in various forms, which is probably the safest outlet for their energies ; but 155 are

raisers of farm stock, which implies that they constantly handle animals supplying milk, ghee, cheese, etc.; 281 are connected with "industries of dress and toilet;" 59, with "food industries;" and 422, with "trade in foodstuffs." Fourteen male lepers are hotel or restaurant keepers; 17 practise medicine; 33 are in domestic service; 38 are fishermen, who probably sell their catches; 38 are schoolmasters of some sort; 11 policemen are returned as lepers; 77 lepers are engaged in religious duties, and 6 find place under "Public administration."

54. Among the insane there are some occupations which provide food for reflection.

55. Two lunatics appear to be employed on transport by rail; one is in the army. "Public administration" claims four—a surprisingly small number, and the police force but one. Twelve are in domestic service; seven are devoted to "Literature, art and science," and a similar number practice the healing art.

56. Deaf-mutes and the blind are largely concerned with the land, or else procure a living "without definite occupation." But eight deaf-mutes, and five blind men are engaged in "Public administration;" there are 29 blind medical men, and two who can neither speak nor hear. Sixteen policemen are deaf-mutes, and three are blind; three deaf-mutes have returned themselves as employed in the "Post, Telegraph and Telephone services."

57. Civil condition is a more serious subject. More than 12,000 lepers are either married or widowed, and of this number 8,500 come under the former category.

Age period.	Married lepers.	
	Male.	Female.
20-40	2,043	710
40-60	1,025	647
60 and over	941	71

The vast majority of such persons are at comparatively advanced periods of life, and it is charitable to suppose that these marriages were contracted before signs of the disease became patent. But 12 boys and one girl at the period 0-10 are married; as are 13 boys and 11 girls at 10-15.

58. All entries for the insane, and those otherwise afflicted, were not examined in this connection. Of 62 slips for male lunatics, picked up long after sorting had concluded, 20 showed the person thereon described as married, and all such were above 20 years of age. Of 99 women, 39 were married, and 29 widowed; one married woman being under 15 years of age, and two more between 15 and 20. To similar information in respect of deaf-mutes allusion has already been made.

59. Among lunatics 681 males and 65 females are literate, 149 men and 46 women being literate in English. Among lepers 1,700 men and 45 women are literate; the deaf-mutes have 180 literates (120 men and 60 women), the majority of these, (51 males and 54 females), being found in Tinnevely, where missionary enterprise is concerned with these poor people. The blind have 493 literates, of whom 465 are males; but inasmuch as blindness may come at any time, there is no positive conclusion to be drawn from these figures.

I. --Number afflicted per 100,000 of the population at each of the last three censuses.

CHAPTER XI.—CASTE.

TABLE XIII, Part I, shows us 479 sets of people, each set wearing a distinctive label. This formidable total, chiefly made up of Hindu caste names, might have been swollen indefinitely, were the titles returned by each and every person duly recorded. *Kápus*, for example, shown as a homogeneous community of 2,678,925 souls, are wont to distinguish themselves as Kuncheti, Morasa, Mótáti, Pókanáti, Velanáti,* etc.; *Bráhmans* may be classified with far greater elaboration and detail than by the crude though practical system of linguistic distinction; two and a half million *Vellálas* comprise among them a bewildering variety of sub-sects,* of which each will state that it differs from all others, but as to why it so differs, or wherein the differences lies, can rarely give an intelligible answer. Table XVII will shiver the solid block of *Indian Christians* into a dozen or more fragments; *Muhammadans*, theoretically brothers in one common faith, possess or have acquired a pretty faculty of sub-division.

2. Thus the general instruction to enumerators, that each person should describe himself according to his will and pleasure for the purposes of column 4 of the census schedule, proved a counsel of perfection rather than of practice. To its literal fulfilment there existed, even apart from all considerations of space and convenience, certain very apparent obstacles, of which a few may be set forth.

3. Best known of all caste classifications is *Manu's* fivefold division of the people into *Bráhmans*, *Kshatriyas*, *Vaisyas*, *Súdras*, and *out-casts*. *Bráhmans* we have with us, and can more or less recognize; but whatever be a *Kshatriya* in Northern India, he in Madras, despite recent large accessions to his ranks, remains a singularly elusive personage. Of *Vaisyas*, with recollections of sundry perfervid deputation still fresh in my mind, I fear to express an opinion; but their existence among us has been doubted by many, of whom at least one ingenious writer extends his scepticism to the case of the *Súdras*.

4. It was moreover necessary to warn enumerators against the entry of certain caste affixes, current indeed and recognized throughout the Presidency, but which yet fail of distinctiveness. *Rao*, for example, is the favourite affix of the Mahrátta *Bráhman*, but is assumed elsewhere by many other *Bráhmans*, and by some not *Bráhmans*; *Pillai* leaves it uncertain whether the person so described is a *Vellála*, or the *Paraiyon* butler in a European house. A similar uncertainty prevails to some degree in the case of a *Mudaliár*; while the only definite information conveyed by the term *Náyudu* is a suggestion that the bearer thereof, whatever his present rank, occupation, or dwelling, can probably speak Telugu.

5. The table shows that the enumerators, thus instructed, have performed their task well; or else that the ingenuity of the abstraction office has performed it for them. Doubts linger in my mind as to the whereabouts of one unyielding *Mudaliár*, who would be that and naught else, though offered a choice of several hundred other, and equally euphonious, caste names. *Súdras*, as in 1901, remain a modest thousand; but an increase of seventy-eight thousand *Kshatriyas*, and a disappearance of thirteen thousand *Vaisyas*, during the decade will demand some later speculation.

6. But before entering upon any detailed criticism of the results obtained, it may be well to attempt some estimate of the present day position of this caste institution in Southern India. At the outset it will be necessary to clear our minds of the

* In an appendix to the tables of 1891 over 800 sub-sects of *Kápus* and *Vellálas* are given.

idea that caste, as it now exists, bears any close analogy to the social conditions, ancient or modern, of Europe, or perhaps indeed of ancient India. If the belted knight of Merrie England objected to engage in honourable thwackings with the churl, he does not appear to have been affronted by the churlish presence in his hall, or by churlish contiguity on such roads as then existed; while in modern days the western *Bráhmaṇ* or *Kshatriya* is made, not born. The ascent of the fit is possible, although facilities for the descent of the unfit may still need a better organization. In India, the Védántic Aryans, a soma-drinking, cattle-sacrificing, roystering set, brought into contact with an inferior race in an enervating climate, may have felt themselves slipping down the ladder of supremacy, and thus bethought themselves of a system, which, accentuating their exclusiveness, might aid their desperate efforts to maintain the purity of their blood.

7. In later and more anarchical times the caste system supplied a rule of life, under which a man might get himself lived in the economy of every-day society: and, in its functional aspect, it probably kept alive the arts and crafts, which vanishing otherwise would have left the plains dwellers of India in a state of ignorant savagery comparable to that of the African Negro.

8. But in the practical life of the present day there is little trace of the existence of such ideas. "The technicalities, the uncertainties of law; the corruption of both judges and witnesses, encourage a gambling spirit in the people" (I quote a learned professor of history) "and render the modern court for many more attractive than the old caste *pañcháyat*;" despite the laborious information of subsidiary table I, experience recognizes more clearly every day that the son of a priest is not always himself of priestly character; that the descendant of a hundred sweepers is not necessarily so excellent in the quality which he should profess, as one who comes to the sweeping with a mind open and unfettered by tradition. Restrictions on intermarriage persist it is true; but despite their persistence there are not wanting present signs of their recognition as the now needless survival of old time strategy, rather than as part of a scheme which looks to the future.

9. The main positive function of caste to-day would seem to be the superabundant remedy of that deficiency in practical regulation, which was noted in Chapter IV as characteristic of an abstract philosophy generally known as the Hindu religion. At what time the lines of religion and of social discipline coalesced, or by what degrees they tended towards coalescence, it would be difficult to say; their coalescence was illustrated at some previous enumeration by objections then raised against profanation of Hinduism's *arcana* by nominal inclusion in the faith of the outcast. Their tendency to diverge, under stress of modern conditions, grew clear in 1911, when the suggestion that the outcast, rejected socially by Hinduism, was not a Hindu by religion, and possibly not a Hindu in any political sense, awoke to life a love for the depressed brother that had long lain dormant.

10. As to the theoretic defensibility, or indefensibility of the caste idea there is something to be said, before we pass to a consideration of its vitality to-day. A system which has endured so long, and under which countless millions have lived, and millions still live, with more or less content, must needs have found not a few opponents and defenders: both, it is probable, have erred at times through excess of zeal. It is a disregard of all teachings of history to assert that this system was never aught than the worse than worthless institute of a selfish theocracy; it is no less an insult to common sense to defend the revolting doctrine that some human beings are born untouchable inheritors of unknown sins, and objects of just avoidance to the portly concentration and embodiment of equally unknown virtues. So far as the equality or inequality of all mankind is concerned, it may fairly be conceded, on the one hand, that varying natural ability and varying opportunity will inevitably produce very varying results, and that intimate social connection and intercourse between persons of widely different habit of life has never been, and never is likely to be, anything but a pretence equally disagreeable to both participants; on the other, that it was a mistake to

assume that, because the social groups of one time were obviously not all of equal position, the degrees of inequality could be stereotyped, and applied for ever to the descendant groups of succeeding ages.

11. It is possible that the idea of caste has struck its roots into Hindu life as a whole too deeply for its eradication to be possible, or even particularly desirable. But the manner of the idea's presentation is certainly undergoing a change. Of small account are ideas of "social service," borrowed perhaps from Christianity, which now direct missions to the depressed classes. Such sympathy once informed Vaishnavism, whose votaries are not now the least exclusive in their daily walk and conversation; and if the "untouchable" is willing to accept himself as such, and thereby claim the commiseration of his twice-born brethren, it is unlikely that he will thus attain to, or deserve, improvement in his material or moral circumstances. More significant is the irritation produced by the social precedence tables of 1901, which has found vigorous expression on the part of many, no longer willing to admit their polluting abilities in black and white. Caste remains—there is no anarchical wish to tear up the rails on which the Indian train has run for so many centuries—so does as yet the possibility of pollution; but with his admission the protestant couples a modest abnegation of his own polluting capacities. Thus the *Shánáns* of Tinnevely, no longer content to "pollute without eating beef," claim to be *Kshatriyas*; as do the "slightly" polluting *Pallis*. *Kammálans*, as will be suggested hereafter, are suspected of an evolution into *Bráhmans*; *Kómatís* disclaim alike liberality to *Máligas* and vulpine intelligence.

12. Or, in other words, if the idea of distinction survives, and possibly waxes stronger, that of innate superiority or inferiority is being exploded from underneath, *Paraiyan Bráhmans* may manifest themselves to the startled gaze of the Census Superintendent of ten or twenty years hence.*

13. Dealing first with *Bráhmans*, we find that the caste has increased during the decade by 111,449 or 9·3 per cent. There are some curious variations in the progress of the parts of this whole. Malayálam and Canarese *Bráhmans* have remained practically stationary throughout the decade, their total increase being but 79 and 43 respectively. Tamil *Bráhmans* have thriven, and show an increase of 15·4 per cent.; followed by Oriyá *Bráhmans* with 12·3 per cent., Telugu *Bráhmans* (5·7 per cent.) and "others" (6·4 per cent.). The remarkable increase in Tamil *Bráhmans* would at first sight suggest that *Kammálans* have fulfilled a much talked of purpose, and returned themselves in large numbers as *Bráhmans*; but the suggestion is not borne out by an observed increase of 12·6 per cent. in this class; while among the Telugu *Kamsalas*, a people probably more troubled about caste than their Tamil brethren, a slower rate of increase (8·8 per cent.) corresponds to that of the Telugu

		Women per 1,000 men.

Bráhmans. The variations in sex proportion shown in the margin do not appear to throw any light on the subject. Disregarding "other" *Bráhmans*, whose correct enumeration must always be open to some doubt, it is curious to note that in the sections showing increase the proportion of women has fallen, while

it has risen considerably in the two sections which have remained stationary.

14. The vagaries of the *Kshatriyas* throughout the last two decades are perplexing, but at least they serve the useful purpose of showing how little intrinsic importance can nowadays be attached to these arbitrary caste labels. In 1891, when the *Kshatriya* stalked abroad a "military and dominant" person, he numbered 155,155; in 1901, when, forsaking war, he was concerned with social precedence alone, he diminished to 80,311. In 1911, when no one cares particularly for his warlike abilities or his social standing, he has recovered his losses, and presents a solid phalanx of 158,521. Allowing as well as may be for the

* The *Baḷagas* of the Nilgiri Hills have put forward a claim to rank as "*Mountain Bráhmans*."

mentioned in Chapters I and II, we may make a marginal attempt to track him to his lair. Inasmuch as the warlike spirit of the Presidency has not perceptibly diminished or increased in the last twenty years, it is scarcely worth while to look further than the whim of enumerator or enumerated for an explanation of these figures; unless indeed they typify a growing desire, already alluded to in paragraph 11, to exchange a definite, and not over much honoured, social label for one implying a vague respectability. The explanation is very

probable in the case of the northern zamindar or *rāja*, whose desire is readily communicated to his retainers; and at first sight offers some explanation for the variation in the fifth division. The *Shánáns* of Madura and Tinnevely districts, pre-eminently the home of this aspiring class, numbered 350,027 in 1891, as against 35,283 *Kshatriyas*. Ten years later, when *Shánáns* had risen to 379,185, *Kshatriyas* had fallen to 14,573. Disgust at the lowly position assigned to them at the last enumeration may in 1911 have inspired some few *Shánáns*, whose numbers in Madura, Rámnád and Tinnevely have risen to 409,147, or by less than 8 per cent., while *Kshatriyas* in the same districts have risen to 23,848, an increase of 63 per cent. in the decade.

15. It is scarcely worth while labouring this point. Even supposing that nine thousand and odd persons, formerly styled *Shánáns* have now preferred to return themselves as *Kshatriyas*, this absolute number is far too small to affect the figures of the great *Shánán* community in these districts, where, indeed, increase is greater than in the *Shánán* caste as a whole (6·4 per cent.).

16. But while on the subject of these *Shánáns* it may be well to consider for a moment a hint given by the census tables of 1891, which suggests that the caste is exposed to defections on another side.

17. In that year, of 278,887 *Shánáns* in the Tinnevely district, 19,196 were returned as Christians; as were 2,052 of 71,170 in Madura. Tinnevely, as already noted in Chapter IV, has been a particularly fruitful field for missionary enterprise, and prominent among the people that have embraced the faith are undoubtedly the *Shánáns*. Exact comparison is impossible, both because of territorial changes and of abandonment of the attempt to ascertain the caste of converts to Christianity. But between 1891 and 1901, while the *Shánáns* of Madura and Tinnevely increased by 8·3 per cent., Indian Christians increased by 10 per cent. Between 1901 and 1911 *Shánáns* show an increase of slightly under 8 per cent. against an increase in Indian Christians of 15·5. Of the slight fall in *Shánán* increase an explanation may be found, either in an increasing number of conversions among *Shánáns*, or in a gradual abandonment by those converted of the old caste name in favour of the general term "*Indian Christian*."

18. In view of the zeal with which various sections of the community, generally known as *Kómatís*, urged an intangible and harmless claim to be considered *Vaisyas*, it is somewhat surprising to find that the number of persons so returned has dwindled from 19,159 in 1901 to 6,042 in 1911, and that these six thousand persons are all found in Madras City; while the number of *Kómatís* has risen from 428,188 to 498,295, or by 16 per cent. A theoretical explanation may be that the arguments addressed to me on the subject were concerned mainly with the place assigned to *Kómatís* in the social precedence table of 1901, and with certain remarks in the caste glossary considered by the members of the *Kómatí* caste as derogatory, rather than with the intangible difference between two abstract names. Satisfied that no attempt to estimate the social unimportance of any one would be made on the present occasion, the *Kómatís* may have ceased to trouble themselves about the matter, and returned a name certainly of more current usage in

the Presidency. One more practical may be that the returns of Madras City were compiled by picked men, who were aware that the difference between *Kómati* and *Vaisya* was a subject of discussion; the larger staff, which dealt with the districts, in all probability regarded *Vaisya* as an affected synonym for the more generally current term.

19. *Súdras*, returned simply as such, we have already seen to be few in number. In practice it is not difficult to decide what is a present-day *Súdra*: in theory so much may be said, and has been said, as to whether the *Súdra* of Madras in any sense identical with the *Súdra* of "*Manu*," that the question is better left alone.

20. Subsidiary table II shows the increase or decrease which has occurred during the decade in the strength of the main castes of the Presidency; and, so far as possible, exhibits similar figures for the ten years immediately preceding. Notes in column 7 of this table explain, or attempt to explain, the reasons for abnormal differences, and draw attention to different methods of grouping or separation observed at the last three enumerations.

21. Beyond observing that the reader interested in the fortunes of a particular caste can ascertain its numerical advancement or decline by simple reference to this table, I find little of interest to say on the figures, which it sets forth.

22. Taking a few typical castes throughout the Presidency, we find that *Vellálas* the cultivators of the south, have increased by 6·6 per cent.: the *Kápus* of the Telugu country have fared poorly with but 4 per cent. increase, while their fellow cultivators, the *Kammas*, have added 15·6 per cent. to their numbers. A similar curious discrepancy is to be found among trading classes, *Kómatís*, as already stated, having increased by 16 per cent., against the 3·2 per cent. of the *Balijs*.

23. At the uttermost end of the scale Tamil *Paraiyans* have increased by 9·8 per cent.; Telugu *Málas* cum *Mádigas* by 7·3 per cent.; while the Canarese *Holeyas* have decreased by 8 per cent. all round, and by 6·9 per cent. in South Canara.

24. The explanation of this latter decrease may lie in the fact that the *Holeyas* are rather a medley of low castes than one caste in particular; and many *Holeyas* of 1901 may now masquerade under different names. This assumption is rendered probable by the fact that in Part II of the present table XIII the minute detail of 1901 is not reproduced. In that year 45 caste names accounted for 672,225 of a total Hindu population of 914,163 in South Canara; the list has now been curtailed to 7, and includes 509,499 of the 949,427 Hindus in the district. All castes have been recorded in Part I of table XIII, but the figures quoted in the margin suggest the query, applicable in many other cases, whether castes, whose absolute numbers are so exceedingly small,

and whose fluctuations in the short space of ten years are so incomprehensible, can have any real existence as separate entities.

25. The enormous strength of the Tamil *Paraiyans*, (their men constitute about one-seventh of the Tamil-speaking population of the Presidency), gives food for reflection in these present days. Sympathy with the sufferings of depressed Behemoth is in the air; much mission-to-the-depressed-classes work is on foot. But what if in India, as elsewhere, Behemoth grow suddenly conscious of his sufferings, and direct rude efforts to the amending of his lot? Telugu Behemoth is equally cumbrous, but his *Mála* head and *Mádiga* tail pull different ways; till he sees the error of his ways he is not likely to emerge from his present wallow.

26. For a curious illustration of this *Mála-Mádiga* antagonism I am indebted to Mr. H. R. Bardswell, I.C.S. It relates to "*Chindhu* dancing"—a practice which prevails in the Kóilkuntla and Nandyál divisions of Kurnool, and in the Jammalamadugu taluk of Cuddapah.

Caste.	1911.	1901.
Kichsgára	28	33
Killekyáta	1,319	337
Maléyava	136	239
Pánára	258	384
Stáavika	255	1,469

27. The dance is performed by *Mádigas*, and its main object, or certainly its main result, seems to be to infuriate the *Málas* to the pitch of frenzy. The music for the dance is played on a particular species of tom-tom called "*tappeta*," a large round instrument with the skin only on one side. This instrument is also used for the playing of "*Koluva*" music, to which no one takes exception, while the mere playing of "*Chindhu*" music is sufficient to cause trouble.

28. The dance consists in the adoption of a number of attitudes, which, Mr. Bardswell says, must be seen to be appreciated, accompanied by the waving of a cloth and the brandishing of a stick, which probably represents a sword. The origin of the dance, and the reason for its offensiveness, are alike uncertain; but Mr. Bardswell thinks that it originated in the celebration by the *Mádigas* of the rape of a *Mála* girl from the *Málapet* by one of their number. The *Málas* endeavoured to rescue the girl, but the ravisher beat them off with his sword, (now represented by the stick), and carried off in triumph the girl, and a cloth which he snatched from one of the pursuers.

29. Another interesting feature of the whole performance is that, outside the *Mála* and *Mádiga* communities, there are certain "*Chindhu*" and "*antichindhu*" groups. The latter group includes *Kómatis*, *Gándlas*, *Balijas*, *Mangalas*, and in general all who follow the "*Chetti religion*" (చెట్టి మతము), which appears to be, broadly speaking, Saivism. Chief among the "*Chindhuists*" are the *Kápus*; but Mr. Bardswell supposes that all connected, in a popular sense, with Vaishnavism and Saivism respectively support or oppose the performance. It can of course have no real connection with these forms of religion: the *Bráhmans*, who represent philosophic Hinduism, decline, as one would expect, to associate themselves in any way with the exhibition.

30. An opinion indirectly expressed by another community on the relative positions of *Mála* and *Mádiga* is interesting. A *Chenchu* strongly objects to being called either a *Mála* or a *Mádiga*; but of two evils he much prefers the former.

31. The unwieldy proportions of the first part of table XIII are considerably modified in Part II, where only those castes or tribes are entered which include one per mille of the Presidency population; and where existence of a caste in a particular district is not noticed unless the members of such caste amount to more than one per mille of the district population.

32. Adopting a useful, if unscientific, system of linguistic and religious division, we are left with 36 Tamil, 40 Telugu, 5 Malayálam, 12 Canarese, and 11 Oriyá, castes; 9 castes of "other Madras languages;" 6 Muhammadan "tribes," and one body of "Indian Christians;" these comprising all but an unappreciable minority of the people of Madras.

33. The list may be reduced still further. Taking a district from each natural division, we find that 2 Tamil castes, 26 Telugu, 1 Canarese, 10 Oriyá and 3 "other," castes account for 1,438,050 of the total Hindu and "Animistic" population (1,863,034) of Ganjam; 1 Tamil, 25 Telugu, 3 Canarese, and 3 "other," castes for 746,388 out of 772,446 in Cuddapah; in Chingleput, a district divided between Telugus and Tamils, 21 Tamil castes, 20 Telugu castes, one Canarese, and one "other" caste, include 1,302,139 of 1,343,601 Hindus and Animists; of 2,141,196 Hindus in Tanjore, 28 Tamil, 10 Telugu, and 4 "other," castes comprise 2,092,833. Sub-division is still easier in Malabar, where 1,459,305 Hindus out of 2,008,082 are included in but five castes.

34. In the light of these figures it is worth while considering whether much of what now is talked about as caste distinction, may not be but the social and racial differences observable in every country, and between groups of countries; overlaid in India with a veneer of semi-religious tradition, to which last foreign observers have for the most part confined their attention.

35. Every self-respecting caste, it is true, can trace its proper and exclusive descent to some philoprogenitive God or Rishi; just as in Ireland there are few pretenders to respectability unconnected with ancient Milesian kings. In the

wilds of North Arcot, at some place of which I have forgotten the name, I held converse with an ancient *Kuravan*. In a curious jargon, compounded of Tamil and Telugu, he related to me the descent of his caste from somebody or something, that landed from an impossible boat on the shores of a highly improbable sea. At Srivaikuntam in Tinnevely are found one of the oddest peoples in the world;—a tribe of *Vellálas* who live within the circle of a lofty mud wall, and deny admittance to strangers. They carry female seclusion beyond the limits of insanity, their women not being allowed to leave the houses in which they are born, much less go abroad within their fort. They are provided with incontestable proofs of their difference from everybody else, and they presented me with a printed history of themselves.

36. The happy result of their peculiarities can be seen by a consideration of a few detailed figures. The community numbers 52 males and 42 women. Of these 42 women 17 are widows, and, not being allowed to remarry, are useless for the purposes of increase. Of 18 married women at least 6 are past child-bearing age; seven unmarried women are aged 15 years or under. Of 52 men 18 are married; and 20, unmarried or widowed between the ages of 20 and 50, obviously cannot find brides within the community. The hopes of the continued existence of this people rest then on 12 married women and 7 unmarried girls; but, considering the fact that 16 married women had between them only 8 children in the last decade, these hopes cannot be considered particularly bright.

37. In reality my ancient *Kuravan* did not differ particularly from other bad old men of my acquaintance. He stole, but excused himself on the grounds that he only stole trifles such as fowls and grain, which were necessary for his support: he did not care for regular work, finding it much pleasanter to wander from village to village and see the world; he disliked jail, whither he had been a few times, on the quaint grounds that there one had always to answer the calls of nature at the same place. The Srivaikuntam *Vellálas* are probably the descendants of some old poligar and his retainers, who, having rendered themselves locally unpopular, built a fort and held on to their lives inside it. The kingly ancestors of Ireland were described with a measure of probability by an Irish Judge now deceased as a people who “roamed the boglands without a garment to cover their latter ends.”

38. Or, in other words, the objection of the cultured *Bráhmaṇ* to intermarry or “interdine” with the rude if estimable *Kápu*, is not at bottom much more or much less strange than the prejudices, which in England debar the duke and his tenant-farmer from the intimate enjoyment of each other’s society. Again, if Tamil and Telugu castes are more or less irrevocably distinct, despite the fact that, in point of social status and occupation, they are resolvable into complementary groups, it may be observed that similar differences are common in Europe between groups identical in status and occupation, but dissevered by the accidents of distance, language, and race. The Tamil cobbler is distinguished from his Telugu fellow-craftsman, in point of language, and by the fact that distance as a rule renders intercourse difficult; intermarriage and exchange of hospitality are almost as uncommon between the English cobbler and the French *savetier*. Higher up in the social scale we may at times light on a sub-conscious element of racial distinction or indeed antagonism; its clash with active personal inclination has been treated finely by a recent French writer. This last element of difference is especially helpful at the point at which the analogy appears to break down; namely when we observe that castes ascribed to one language are often spread through territories where another prevails, and yet keep themselves apart. It is curious, for example, to observe how, in the Ceded Districts, the Tamil and the Telugu, born in the same place, and living in perfect amity, have at bottom a certain dim indefinable hostility to each other; how even the southern *Muhammadan* of the Presidency talks the same language as the northern, prays with him, eats with him, at times intermarries with his family, and yet remains slightly apart. An amusing instance of acquired “racial antagonism” can at times be noticed in the case of Europeans domiciled in different parts of India.

39. Of obscure difference or antagonism no better illustration can be found than that which once prevailed, and which still faintly survives, between *right-hand* and *left-hand* castes. Utterly senseless to European eyes, this distinction was, according to one of my informants, of sufficiently vital import to account for the slaughter of thousands in the neighbourhood of Porto Novo and Cuddalore some seventy or eighty years ago. The fact of its existence is noted by early writers such as Sonnerat, Dubois, and Buchanan, but to explain its why and wherefore from information available is little less difficult than it would be to educe a reason for the struggles of the Guelphs and the Ghibellines from a perusal of Browning's "Sordello."

40. A theory has been propounded that this distinction is the survival of exogamous grouping precedent to the institution of the caste system. But exogamous principle will hardly account for scenes of frenzied bloodshed, which it needed the strong rule of the British Government to suppress; and such accounts as I have been able to procure point rather to some underlying idea of social, racial, or religious difference.

41. In his "*Prospectus of the Scientific Study of the Hindu Law*," Mr. J. H. Nelson has put forward an explanation which assumes an ancient and sharply marked distinction between the artificers of the country and the agricultural, mercantile, and other classes. In proof thereof he quotes the *Mutraransi*, that "King Vijaya, who landed on the day of the death of Buddha, sent an embassy to Madura, which brought back a princess with 700 female attendants, a train of men of eighteen different classes, and also five different classes of workmen." The number eighteen is significant, inasmuch as in later days a petition dealing with the existence of the quarrel, though not with its causes, was presented to the Government of Madras by the "eighteen sorts of people of the right-hand castes of Chennapatnam." An element of religious exacerbation is then introduced by the supposition that the "eighteen sorts" of the right hand accepted the spiritual supremacy of the *Bráhmans*, which the artificers, principally the goldsmiths, ironsmiths, coppersmiths, carpenters, and masons, denied; as, in theory at least, they still do.

42. Mr. Chokkalingam Pillai, who has written to me at length concerning the havoc caused by this dispute in olden days, places its origin more simply in a dispute as to the place of honour in temples or shrines, where the old inhabitants of the peninsula, then too divided into functional groups, conducted their worship. The cause of the dispute was soon forgotten; the dispute itself waxed hotter and hotter with accessions and desertions to and from either side. His explanation, if simple, is not necessarily untrue; history affords many instances, especially where religion has been in even remote question, of disputes as absurd with consequences as direful.

43. But the division is passing, we may hope, into the limbo of things forgotten. It emerges at times in amusing form among the *Pallans* and *Chakkiliyans* of Trichinopoly, where women and men belong to different *hands*, and contention waxing high leads to "strikes," such as depicted in those comedies of Aristophanes which are not as a rule recommended for school use.

TRIBES—(1) ANIMISTIC.

44. In this chapter's attempt to treat of the Animistic tribes of the Presidency the place of honour is due to the following account of the *Gadabas* of Vizagapatam Agency, furnished to me by Mr. C. A. Henderson, I.C.S.

45. "The most interesting of these peoples to my mind are the 'Munda' stock, generally known in the Jeypore Agency as *Gadabas*. They are clearly divided into three tribes, the *Bonda Porja*, the *Gutób*, (or *Bodo Gadaba*), and the *Parenga Gadaba*. I arrange them in the order of seniority as they appear to me. They cannot be mistaken; the Mongoloid cast of countenance is at times very marked, this being the case, as I have noticed, rather more often among the women than

among the men ; at least among the younger men. The typical old hill man's face, as once described to me, was exemplified in the Naik of our village near Koraput, who was a *Jhodia Porja*. The face is flat and an obliquity of the eye is traceable ; the hair on the face is rather scanty ; the stature is short and build sturdy.

46. "The *Bonda Porja*, so-called, I take to be the most primitive. But if the general theory of the advance of these peoples from the north is sound, they would have been the farthest and most southerly outpost of the stock. They live on or below the range of Ghâts, which divides the 3,000-foot plateau from Malkangiri taluk ; that is to say on the edge of the Koi country, and a most remote unvisited part of the world it is. They have been so secluded for years and generations by the circumstances of their tract of country, that I do not think I am wrong in believing them to be the most primitive and authentic remains of the Munda stock that we have. Their customs and clothing in many ways suggest that they are at a stage which the better known *Gadabas* of the upland taluks passed some time ago. Their language also as compared with the *Gutôb* bears this out in some small ways. The two vocabularies are obviously of the same stock of speech, and nearly related, but the *Gutôb* is the more developed.

47. "Clothing is to my mind a crucial test. The *Bonda Porja* tabu, which prevents their women clothing themselves above the waist, is well known. They supply the very patent deficiency by a mass of brass and bead necklaces, and by large heavy circular collars of brass, often of great weight. I sent my specimens to the Museum. These collars are locally made, and are jointed at one side, with a male and female clasp at the other end, which is secured by a bit of string or fibre. The loin cloth is extremely exiguous. In fact in fully developed woman it does not meet round the hips. It is half suspended from a string, and shifted round the body to meet the exigencies of the moment. They shave their heads from early childhood, and tie round them a fillet of palmyra, or a string with olive shells or little scarlet seeds on it. Compare the familiar *Bodo Gadaba* (*Gutôb*) found in villages on the main road near Koraput. The women's clothing is distinctly in two parts, a kilt and an upper cloth. A little observation and reflection would, I think, convince any one that the adoption of the *upper* cloth is comparatively a recent matter. In the first place the cloths are separate ; the upper cloth is not a continuation of the lower or kilt, and is not twisted over the bust, but simply knotted on one shoulder. In the second place these *Gadaba* women are not inordinately shy about showing their breasts, *e.g.*, when suckling children, and will often do so unconcernedly even in a European's presence. On one occasion, riding past, I saw a *Gadaba* woman coming from a wash. She had only got the kilt on, and the upper part of her body was quite bare—a contrast to the way in which the local Oriyá woman contrives to conceal herself as far as possible when bathing. Another point in favour of this belief is that the *Parenga* women, though they retain their tribal cloth for the kilt, have not adopted, as the *Gadabas* have done almost universally, a cloth of the same make for their upper garment, but wear an ordinary white, or would-be white, cloth on the shoulders. All three, I am convinced, till comparatively recently were unclothed above the waist ; and among the remote *Bonda Porjas* the custom has persisted, backed by a pretty strong tabu, which however, curious as it may appear, does not extend to their life indoors, where they are permitted to cover themselves completely. The fillet of the *Bondas* is common among the *Gutôb*, but the latter have ceased (on my theory) to shave their heads. The *Gutôb* 'bustle' is unknown to the *Bondas*, why I do not know ; neither is it the fashion among the *Parengas*, because 'God did not give it to us in the beginning of things,' or words to that effect."

48. "Here I insert my protest against the use of the word '*Porja*' or '*Poroja*' in any scientific account of these peoples. The word is simply the Oriyá form of the Sanskrit '*praja*,' as '*rôza*' is the Oriyá for '*raja*.' Their difficulty in pronouncing the double consonant 'pr' is shown in the fact that the word

'*promano*,' an oath, is invariably pronounced '*pormano*,' at least in Jeypore. The word '*Porja*' is thus explained etymologically. Its meaning is 'subject'; that is, the people overcome by the conquering Oriyá and reduced to the position of tenants, though most probably they had held their own land, (as the Ganjám *Khonds* have almost always done), previous to his advent. The word now means no more than '*rayat*.' To take *Porja* as a generic term, and assign to it the species *Bonda*, *Pengu*, *Jhodia*, etc., as done at times, is to make confusion worse confounded; and scientifically as effective as to make a generic class of *rayats*, and sub-divide them into *Kápu rayats*, *Vellála rayats*, *Oriyá rayats*, and so on.

49. "I pass to the so-called *Bodo Gadaba*, familiar to any one who has stopped in the neighbourhood of Sembliguda. Their name for themselves is *Gutób*—a fact of which I may be the first discoverer. And I believe, in default of a better explanation, that it is the origin of the name *Gadaba*, by which this people is generally known. The word '*bodo*' is of course Oriyá for 'big.' Their women's distinctive dress has been partly described above in reference to the *Bonda Porjas*. The striped pattern, and the rather gay colours of the cloths, make them conspicuous. There is some account of a tribal custom compelling the women to weave their own cloths before marriage, which is, I daresay, true enough. Then there is the bustle, of which I sent a specimen, bought off the lady's body, to the Museum. Its origin is not quite certain; it is 'to make them strong,' I was told; perhaps a child-bearing charm, or more probably a simple artificial sexual attraction to increase the apparent size of the buttocks, for which purpose it has not been entirely unknown in Europe at certain periods.

50. "The third distinctive section the *Parenga*, I was always disposed to regard as rather inferior, and possibly more mixed than the *Bodo Gadaba* strain. But I discovered from Professor Ramamurti that their language is nearly akin to the *Savara*; while on the other hand it has clear affinities with the language of the *Bondas* and of the *Gutób*, though it is not so nearly related to either as they are to each other. I think these people may be regarded as an offshoot of the *Savaras* rather than as *Gadabas*, though, being like the *Gadabas* in appearance and probably in some of their customs, and by no means dissimilar in language, they have got the latter name in Jeypore. Their women may be distinguished by the wearing of a fibre-cloth kilt, different in pattern from that of the *Gutób*, in that it consists primarily of thin coloured stripes on a white or dingy white background. The *Gutób* cloth is broadly striped in various colours. The scanty *Bonda* cloth was till very recently of a uniform brown, this being, I believe, the natural colour of the fibre-thread. At the present day such simplicity is rare, and the cloth is coloured in narrow vertical or transverse stripes with coloured cottons.

51. "The *Oláro Gadaba*, so-called, are a mystery to me. In the first place their women are outwardly indistinguishable from the *Gutób*, with whom in some places they live. In fact a *Gutób* told me that they could not be distinguished, which was fairly conclusive. At the same time '*olár*' in the *Gadaba* tongue, means a leaf. It suggests possibilities of the clothing of these people having been extremely primitive at no very recent date. I hazard a theory that, coming into the sphere of *Gadaba* influence at a time when they themselves were clothed only with the unmanufactured produce of the jungle, they adopted the dress of a civilization higher than their own, but not before they had earned the name they now bear as a nickname. This depends on the meaning of the word *olár*, and I am quite aware of the danger of anthropological theories based on linguistics. But it may serve as a working hypothesis to explain the curious fact that these people, entirely assimilated to the Munda stock in dress, are, by all tests, of Dravidian speech. If my theory be admitted, even as a hypothesis, it needs only further to suppose that the assimilation took place before the Oriyá conquest, and that the name *Gadaba* with the characteristic nick-name prefixed, survived under the Oriyá domination. The *Oláro* probably would not have been displeased at being ranked with the tribe they had so faithfully imitated; and it is a fact that *Gutób* and *Parenga* have a certain tendency to look down upon the *Oláro*, thus suggesting that the latter are not regarded as true *Gadabas*.

52. "The *Jhodias*, called and calling themselves *Porjas*, are to be found in abundance in the neighbourhood of Koraput and Jeypore. They have no distinctive language at present in use. But this is no proof that they have not had one, and a skilled Oriyá scholar might find out from their dialect of Oriyá that they are entitled to separate recognition, by traces of affinities to the Munda or the Dravidian group. It would be a difficult matter, inasmuch they have always been near the centre of such civilization as the country affords; and are an industrious agricultural population, not at present off the beaten track, or concealed in the jungle. Their women have a distinctive dress, and a particularly neat one too. They wear white cloths, with a cerise or crimson border; neatly arranged in a fashion of their own so as to cover the upper part of the body and both shoulders completely. Their cloth is continuous and reaches to the knee. The women are of curiously short stature, but with wonderfully developed calves. The lower leg is frequently tattooed from the knee to the ankle, and so closely as to give the appearance almost of a stocking. Their 'dancing' is the best that I saw in the Agency, but the villages near Koraput have considerable practice, as they are always dancing as a show for European visitors. The men have certainly traces of a Mongolian cast of countenance, and on the whole I should be inclined to place these *Jhodias* with the Munda group, but they would be a branch very superior to the *Gadabas* if this is so.

53. "I note one error, as I take it, perpetuated in Thurston's 'Tribes and Castes.' He refers to the peculiar *Gadaba* custom of placing swings with spiked seats outside their temples, on which the *pújári* swings in a sort of ecstasy, and feels no pain, by virtue of the power of the goddess that is in him. I can only say that by my experience such swings are commonest in the Naurangpur taluk, where, with the exception of an isolated and rather degraded settlement in Naurangpur town, (that is to say at the extreme southern boundary of the taluk), there are no *Gadabas*. At any rate it is absurd to ascribe this spiky swing to the *Gadabas* alone, when it and similar practices are known to be quite common in many other pseudo-Hindu cults.

54. "As to the religion and customs of the *Gadabas* and their kind I can say practically nothing. I have tried to find out, but the people are very reticent, and cannot, or will not, say more than that the important events of life are the occasion for a family, tribal, or village, feed . . . and drink. At the same time both *Bonda* and *Gutób* have a belief in, and a name for, the spirits of the departed (*sayiré* or *se'arraí*), who seem, according to their ideas, to exercise some beneficent influence on the crops. There are also gods and goddesses of the jungle. I should say that they are or were purely Animists, however the *Gutób* may have been Hinduised externally. Their position in the scale of caste is peculiar; I am certain that there are degrees of pollution among them, and that they are not all lumped together as untouchables. The *Domb*, *Ghasi*, *Haddi* and *Chachudi* are the lowest of the low, as far as my knowledge goes. But of these things they will not talk readily. I know that some of them have most elaborate mythologies and cosmic beliefs, but they never confided in me to any great extent. The *Bondas* certainly practise village exogamy; the well-known 'marriage pit' is still an institution among them, though they do not talk much about it, and will, I feel sure, deny all knowledge of it, if asked point-blank. I asked questions about birth, marriage, and death, but was never able to get any convincing answers. This is after all no new thing. First-hand research in these matters is always exposed to this difficulty. Some enquirers have not always the scientific honesty to admit it, or to allow for the possible vagaries of an interpreter."

55. Abandoning detail for the moment, it may be suggested that a consideration of more useful, though of less curious interest arises in respect to these hill tribes in general. The manner in which they do not dress, the dialect in which they make themselves incomprehensible; these are largely their own affair. But could definite, or approximately definite, information on the subject be obtained, it would be of practical value to learn how far the hill tribesman, widely different from the Hindu of the plains however he be returned, suffers or benefits by the gradual opening

up of his country, and inroad of the more sophisticated trader and settler. This question, which at times suggested itself to me when I lived among the *Khonds* of the Ganjám Agency, was raised in 1910 by Mr. Cammiade, who suggested that statistics should be compiled for the villages of the Gódávári Agency, showing, not merely the number of Hindus, Muhammadans, Christians and Animists in each village, but rather the number of genuine hill-men there found.

56. The suggestion was not acted upon, and for certain reasons is one of doubtful practicability in connection with an ordinary census. It would first be necessary to get an accurate list of castes and tribes considered to be "hill-men;" then special and detailed instructions would be needed for the enumerators, who, in these wild tracts, are difficult to find, and not, as a rule, among the most competent of their class. Were these difficulties overcome, special sortings and the printing of special tables would be necessary; for all of which work funds were not on this occasion immediately at hand. In a thorough investigation of the subject it would be necessary to add enquiries regarding alienation of land, indebtedness of the hill-men to traders from the plains, values of produce in the plains' markets, and prices paid therefor to the cultivator in the hills, increase or diminution in the consumption of intoxicants, and sundry other points—work for which the ordinary census enumerator certainly has not enough time, and probably does not possess sufficient intelligence. If the matter is not taken up beforehand as a special enquiry, my successor in 1921, with the problem thus early placed before him, may find a means to its solution.

57. This however by the way. Returning to tribes in particular, *Khonds* and *Pános*, people written well nigh to death, exhibit fluctuations during the last

Tribe.	Decennial increase.	
	1901-11.	1891-1901.
Khond	+ 12·1	- 3·2
Páno	+ 16·5	+ 32·8

two decades, which suggest that at some enumeration there has been considerable confusion in their respect. It is unlikely that after losing 3 per cent. of their numbers between 1891 and 1901

the *Khonds* should increase by 12·1 per cent. during the last decade; or that the increase of the *Pános* should diminish from 32·8 per cent. between 1891 and 1901 to 16·5 between 1901 and 1911. A high rate of increase among the *Khonds* Father Vulliez, who knows the people intimately, considers improbable on account of their antenuptial promiscuity, which leads in his opinion to a low natality of children, frequent abortion, female sterility, and the spread of venereal disease. Moreover the general prosperity of this people is not likely to be furthered by drunkenness, which the Collector of Ganjám considers to have increased of late years; but at the same time both he and Father Vulliez agree that some signs of improvement in this respect are becoming manifest, following restrictions introduced in the number of shops licensed for the sale of drink.

58. *Savaras*, to whose affairs some space has been devoted in the chapter

Tribe.	Rate of increase per cent.	Women per 1,000 men.
Savara	1·6	1,026
Khond	12·1	1,011
Páno	16·5	1,001

dealing with religion, present no feature of interest save a consistently slow rate of increase. As in the case of *Bráhmans* it is somewhat curious to note that the rate of increase in the last mentioned

three tribes is more or less in inverse proportion to the number of women.

59. The *Tódas* of the Nilgiri hills, according to table XIII, part I, number 748: their real number is, in all probability, some 50 less.

60. At the date fixed for the general enumeration (March 10th) it was unlikely that the *Tódas* would be found in the *munds*, where they, as a rule, reside; their custom at such season being to scatter with their herds of buffaloes through the pastures on the Kundahs. A special enumeration was accordingly held on December 15, 1911, when 383 males and 293 females were enumerated. The remaining 72 *Tódas* of table XIII, part I, were found here and there at the general enumeration; and, from the similarity of the schedule entries on either occasion, it is probable that nearly all, if not all, of these latter *Tódas* represent cases of double enumeration.

Observation of this fact may serve to some extent as an explanation of the strange rise and fall in the numbers of this people, which is shown by the figures, quoted in the margin, of the last four enumerations. In view of the fact that most persons

Year.	Tóda population.		
	Total.	Males.	Females.
1911	676	383	293
1901... ..	805	451	354
1891... ..	739	427	312
1881... ..	675	...	...

with an intimate knowledge of the *Tódas* consider that they have long been a dying people, their increase from 1881 to 1901 is strange, and renders inexplicable their sudden set-back in 1911. Of the various hypotheses propounded in explanation by far the most credible is that of double enumeration escaping notice on previous occasions; although

it must be admitted that this assumption involves another—namely, that a great many really existent *Tódas* were left out of account at the census of 1881.

61. It is worth while to examine present *Tóda* statistics in some detail; the basis of examination will be the schedules of their special enumeration.

62. *Tódas* aged 0–10, or the survivors of those born in the last decade, number 128; 74 being boys, and 54 girls. Male *Tódas* at present aged 20–50 are 188; women aged 15–40 number 140. Assuming that there were during the period 1901–1911 125 couples at the reproductive period of life, 128 surviving children represents a low rate of healthy natality.

63. Mr. Gordon Hadfield, who probably knows more about the *Tódas* than any one now living, tells me that the race as a whole is so rotten with syphilis that miscarriages are extremely frequent; while children actually born are in many cases horribly diseased, and die off like flies. It has been suggested that immorality is only prevalent among the *Tódas* who live on the outskirts of Ootacamund, with its large servant and cooly population; and that those of the outlying country are in the main decent folk. But in fact there are few *Tódas* save in the vicinity of Ootacamund. There are 12 in Gúdálúr taluk, and 105 in Coonoor taluk. Of 559 in Ootacamund taluk 83 are within the limits of Ootacamund village: 154 are at Shólúr, and 192 at Nanjinád; both within easy reach of the town.

64. To their misfortunes drink, opium, and poverty may contribute. Of the 676 *Tódas* 561 depend on buffalo grazing for a livelihood: there are 33 coolies, and 9 beggars. Buffalo grazing is a failing stay: murrain some years back wrought havoc with the herds. For the buffalo products, such as milk, ghee, and cheese, the *Tódas* obtain advances from traders: the money they squander in drink, and have to repay it in kind at ruinous rates.

65. It has been customary, I understand, for the *Badagas* at harvest time to pay a grain tribute to the *Tódas*. The *Badagas* themselves are frequently indebted to traders, and are moreover to a considerable extent abandoning cultivation for the more secure, and, in the Nilgiris, more profitable pursuit of daily labour. There is therefore less grain to go round.

66. It is questionable whether anything is likely to arrest the decay of this curious tribe. Separate registration of their births and deaths as distinguished from those of Hindus, would at least afford a basis for closer investigation of the causes of decay. Prohibition of the sale of liquor to *Tódas*, and compulsory removal of their *munds* from the neighbourhood of the town to the open country, are remedies drastic, but possibly not impracticable in dealing with a mere handful of people.

67. The sudden appearance of some 60,000 additional Animists in the Nellore district has been explained in Chapter IV. Although in certain ideas as to caste, dress, etc., the people in question, the *Yánádis*, conform somewhat to Hindu usage, their classification as Animists is probably not incorrect: “Hinduism” in the popular sense, and “Animism” are vague and widely comprehensive terms.

68. Like most primitive people the *Yánádi* has no particular inclination towards settled work. Cultivation does not appeal to him; while he has anything

to eat he will not work; driven by the pinch of hunger he will collect and sell firewood, watch crops, hunt or fish; in fact do anything not too monotonously irksome and laborious. He cares little for education, despite some theosophical attempts in Nellore town to educate his children; and finds a simple relaxation in singing and dancing to the accompaniment of a drum.

69. The *Yánádi* marriage is, as one would expect, a somewhat free and easy affair. In contrast to Hindu practice it is generally arranged by the inclination of the contracting parties, and as readily dissolved at the caprice of either.

70. A certain social difference exists between sections of the community, founded on the nice point of eating, or not eating, refuse. The opposing sections do not eat together even food other than the questionable dish, nor do they intermarry.

71. Mr. Quadir Navaz Khan, late Collector of Nellore, to whom I am indebted for my information in regard to this tribe, considers that except in Sríharikóta, where they are still extremely backward, the *Yánádis* are, on the whole, improving, though the rate of progress is very slow; and that they possess one commendable virtue—they are not a drinking class.

72. There is an old saw, *testimonia ponderantur non numerantur*. Without indefinite space, time and industry, all of which facilities I lack, it would be impossible to go *seriatim* through the “animistic tribes” of the Presidency. It is questionable whether to do so would serve any useful purpose. From a few examples the general position of these peoples in to-day’s economy of the Presidency can be learned; and, as already observed in paragraphs 55 *supra*, of most present interest in this regard is the question whether their temperament, social customs, religious ideas as now formed, are such as to admit of their absorption into the higher civilization, that is undoubtedly extending towards them; or whether, as in the melancholy case of the *Tólas*, the necessary loss of primitive virtues will be counterbalanced only by the acquisition of more sophisticated vice.

TRIBES—(2) MUHAMMADAN.*

73. The distinction drawn at the census between Muhammadan tribes is anything but satisfactory, particularly in regard to the general division into *Saiyads*, *Patháns*, *Moghals* and *Sheiks*.

74. *Saiyads*, as the term “Children of Fatima” commonly applied to them denotes, are supposed to be the descendants of Fatima, daughter of the Prophet; and as such they not unnaturally enjoy a certain degree of respect and consideration among their fellow believers. But unfortunately material inducements occasionally proved too potent for the veracity of the faithful, with the result that, in Southern India, many calling themselves *Saiyads* have really no claim to such title. The old Nawabs of the Carnatic, themselves *Sheiks*, treated *Saiyads*, it is said, with peculiar consideration, and assigned wet lands as inams for the support of these poverty-stricken saints. The natural outcome was a plenteous crop of impostors: even to this day a delicate insult may be conveyed to a *Saiyad* by calling him *دهن مڑی کا مید* (paddy-field *Saiyad*). The well-known Persian couplet, “I was a *Sheik* in the first year; in the second I became a *Pathan*; if provisions sell cheap this year I shall be a *Saiyad*,” testifies to the reliance that can be placed in these tribal distinctions in modern days. A *Sheik* servant in a rich *Saiyad* family occasionally assumes the title of *Saiyad* as a mark of respect to his patron, or calls his children *Saiyads*; the *Rávuttans* of Tinnevely, it is said, style children born on Friday “*Friday Saiyads*.”

75. *Patháns* are descendants of Khais, a Sirdar of Ghor, who embraced Islam during the life-time of the Prophet, and assumed the name of Abdur Rashid.

* For much of my information regarding Muhammadanism and Muhammadan tribes I am indebted to Mr. Khaja Akber Hussain, Diwan of the Banganapalle State, and to his brother Dr. Khaja Muhammad Hussain.

From him sprung Bora, Jano, Umer, and Timmor, to whom, and to whose immediate offspring, some families in Kurnool, Cuddapah, Gódvári, etc., still trace back their genealogy; and in proof thereof affix to their names the name of their remote ancestor, (thus *Janozi*, *Alizi*, or *Timmerzi*). Such people keep strictly to themselves: they will not intermarry with *Sheiks* or *Moghals*, whom they consider beneath them; and are somewhat averse to marriage with *Saiyads*, whom they consider above them. But these families are comparatively few; throughout the greater part of the Presidency the "*Pathán* in the street" will stare blankly, if asked to what '*zi*' he belongs.

76. *Moghals* are of two kinds, (a) descendants of the early central Asiatic invaders, and (b) domiciled Iranis. The first class have become completely Indianized, and intermarry freely with their fellow believers, from whom they are indistinguishable save by the characteristic prefix or affix, "*Mirza*" or "*Baig*," to their names. The second community have held themselves apart; intermarriage even with their fellow *Moghals* in India, owing to difference in social custom and method of living, is rare. Some of these domiciled Irani *Moghals* are to be found in certain streets of Madras, where they chiefly occupy themselves with trade in indigo. I do not know if they are found elsewhere, unless there be some such families on the west coast.

77. *Sheiks* trace their origin to the first Arabic converts to Islam, and the term can also be used with some connotation of religious authority. Nasikh has a verse "When a friend offers wine why should I refuse? I am no *Sheik* nor Saint;" and Hafiz tells, "My *Sheik* said drink no wine: I said I do not lend an ear to every ass." As applied now to the Muhammadans of Southern India the term has little precise meaning. A Hindu or Christian convert becomes a *Sheik*; many *Dúdekúlas* assume the title. The stern unbending *Patháns* referred to in paragraph 73 look down on all such, calling them in derision *بش*, a sort of fresh water crab or fish, which begins to decay immediately it is taken out of water.

78. *Máppillas*, (the name is probably derived from the Tamil மாப்பிள்ளை bridegroom), are confined to the West Coast, and constitute practically the entire Muhammadan population of Malabar. Descended from Arabs, who visited Malabar for trade and formed connections with the women of the place, they are an active bustling community in worldly matters; although, judging from their percentage of literacy (56 per 1,000), polite learning appear to have for them even still fewer attractions than for their fellow believers throughout the Presidency. To their ignorance of Urdu allusion has already been made; in their social ceremonies the use of the tom-tom, and the distribution of betel are strongly reminiscent of Hinduism. More striking still, as a survival or adoption of Hindu custom, is the marumakattáyam form of succession obtaining among the *Máppillas* of North Malabar, and generally throughout the district in respect of religious *stánams*. Their zeal for the propagation of their faith is undoubted, if the means employed to that end are at times somewhat quaint. A correspondent remarks that women employed as maid servants in *Máppilla* houses, often join their master's faith, "when their master has made it difficult for them to return to their own community."

79. *Marakkáyars*, (the word is generally taken to mean "boatman"), and *Jónagans*, (said to be derived from *Sonagam*, the Tamil equivalent for Arabia), are descendants of Arab colonists on the eastern coast. They are chiefly found in Tinnevely and Tanjore. *Marakkáyars* number only 2,461 as against 4,651 in 1901, the decrease being in all probability due to a greater or lesser accuracy of enumeration; *Jónagans* with 8,780 as against 8,646 have remained practically stationary.

80. *Labbai*, a term which some authorities consider should only be used of east coast settlers of Arabic descent, is now a name loosely applied to all Tamil-speaking Muhammadans. Part II of table XIII shows them as inhabiting in the main the Tamil country, although an appreciable number (31,000) are found in Malabar, where they constitute three-fourths of the non-Máppilla Muhammadans. A decrease

of 1·2 per cent. *Labbaïs* in the decade is explained, in all probability with tolerable correctness, by the supposition that many of them have preferred the more distinctively Muhammadan classification of *Sheik*, and thus aided an increase of 13·5 per cent. in this latter section between 1901 and 1911.

81. *Rávuttans* (Cavaliers) were not classified separately at this census, or at either of its immediate predecessors. Converted from Hinduism by the persuasion of Saints whose names and honours survive to this day, such as the Nathad Vali of Trichinopoly, Saiyad Ibrahim Shahid of Érvádi, Sha-ul-Hamed of Nágore, or by the more pointed arguments of a ruler, (it is for example related of the *Nallámpillai Rávuttans* of Madura that they were *Maravan* and *Kallan* thieves, who, sentenced to lose their hands for picking and stealing, “preferred to become Muhammadans”), they are an active thriving community found in the Tamil districts of Madura, Tinnevely, Coimbatore, North Arcot and the Nilgiris. In the latter district, it must be admitted, their business enterprise, and their large-minded views on morality, have at times elicited somewhat marked judicial comment.

82. Reference has already been made to a hint as to racial descent afforded by profession of allegiance to a particular Imam. The author of “South Indian Musalmans” observes that the teachings of Abu Hanifa, who lived in Irak between the Tigris and Euphrates “spread naturally towards the north and east, the other two directions being bounded by sand and sea. Thus the *Turkomans*, *Afghans* and *Central Asian Musalmans*, in fact all races which came to India by the north-west passage were of the Hanafite school of law.” The fact that *Máppillas*, *Jónagans*, and *Marakkáyars* belong to the Shafi sect confirms theory as to their descent from Arabs, who as a rule are Shafis.

RACE.

83. On the subject of *race* there is little to be said. In the chapters dealing with marriage and religion it has been suggested that many of the apparent inconsistencies of Hinduism are due to attempts to combine the religious beliefs of two races at widely different stages of intellectual development, and that certain marriage customs apparently ill advised sprang from the desire of the higher race to avoid intermixture with the lower.

84. Although *Bráhmaṇ* and *non-Bráhmaṇ* still to some extent remain apart time has obliterated much of their salient and external difference. Their present interminglement has been forcibly depicted by Mr. J. H. Nelson as follows: “Are the million and odd *Bráhmaṇs* of the Madras Province, many of whom are as dark skinned and puny as Paraiyans, *Bráhmaṇs* pure and undefiled, true descendants of the white-faced warriors who first overran, and in a sense civilized the north of India? I for one cannot believe that they are such.”

85. Trace of Mongolian descent afforded by blue markings on the hinder parts of children was a subject proposed for enquiry. The matter is one for expert knowledge and opportunity, and unfortunately the quest failed to stir the imagination of the Madras doctors. Among the *Gadabas* of Jeypore were noted some Mongolian traits; but observation, as may be seen, was made *a fronte* rather than *a posteriori*.

86. Of somewhat more practical interest is the fate of the mixed Anglo-Indian

Year,	<i>Anglo-Indians.</i>	
	Males.	Females.
1911 	12,651	13,372
1901 	12,737	13,472
1891 	13,147	13,523

race, wherein the marginal figures show a steady decline throughout the period covered by the last three enumerations. To those interested in the poorer classes of the community decline may not come

as a surprise; whatever hard things may be said of his shiftlessness and incapacity, the poverty-stricken Anglo-Indian is confronted with the grim fact that a body with the needs of European blood will not thrive on the wages that maintain an Indian; and that, granting his intellectual capacity to be but equal to that of his Indian competitor, he must be crowded out of the field wherein he might hope for employment.

87. The decline is chiefly noticeable in Madras city and in Malabar. In Madras

Year.	Anglo-Indians.			
	Madras City.		Malabar.	
	Males	Females	Males.	Females.
1911	4,914	5,412	1,594	1,860
1901	5,305	5,913	1,869	2,105
1891	5,679	6,264	1,986	2,207

city, it may be observed, the community is liable to somewhat artificial defections and accretions. In prosperous circumstances the pure European is at times of somewhat dusky hue; while his brother at the bottom of the scale often relies solely on his manner of dress for his differentiation from the Indian. In Malabar, where, I understand, it is not

unusual for the long-domiciled Anglo-Indian to merge in the native community, the decline is statistical rather than real, being due to the separation of Malabar and Anjengo on this occasion. Anglo-Indian figures in South Canara show some curious fluctuations. A turnover from "Portuguese" to "Anglo-Indian" at the last enumeration occurred to me

Anglo-Indians in South Canara.

Year.	Males.	Females.
1911	140	172
1901	76	77
1891	122	82

as a possible explanation, but examination of previous figures lent no support to the idea.

FORMATION OF SUB-CASTES.

88. Distinction of castes is an obvious matter; the tendency that splits a caste into innumerable *sub-castes*, which some observers consider to represent the only true castes, deserves mention.

89. That the tendency exists is proved by its results seen in Sir H. A. Stuart's elaborate appendices to the census tables of 1891; and *passim* in Mr. Thurston's "*Castes and Tribes of Southern India*." I have found no new grain of sand that I could venture to add to the mountain of information therein contained. My contribution to the subject can only take the form of some suggested reasons for a fact, of which the existence is beyond doubt.

90. Difference is not constituted by its effects, nor by belief in the ultimate effect of such difference as exists. Roman Catholic differs from a Protestant, but the intrinsic difference is not constituted by the mutual belief of the one, that the other is more or less on the broad path; liberal from conservative, but not because of the scepticism shared by either as to the other's honesty. Distinguishing the sub-divisions of a main caste A by the letters a, b, c, d , etc., one may say that X belonging to $A(a)$ does not differ from Y belonging to $A(b)$, because their families refuse to intermarry and "interdine;" rather they refrain from these social amenities, because they differ.

91. Taking first the difference of religious, or better, philosophic belief, the difference between the monism of Sankara and the dualism of Madhva is as wide as that between heaven and earth, between pole and pole.

92. Midway between the schools of Sankara and Madhva come the followers of Rámánuja. Their doctrine possessing some elements in common with each of the other two, a greater catholicity and tolerance might be expected to prevail among the *Vaishnavas*: it is therefore in accordance with the topsy-turvy nature of human affairs that exclusiveness should be the badge of all their tribe.

93. That persons holding widely divergent religious views should express their theological difference by refusal of each other's society may seem at first sight strange; a Hindu writer thus exclaims: "It is really unaccountable that difference of views in matters philosophical should have so acted on its (*i.e.*, the Hindu community) social customs as to crystalize it in varying set forms, so entirely ill-adapted to one another as to defy all attempts for the cementation of the entire community". And a *Bráhma*n friend writing to me with special reference to this philosophical division in a particular district observes: "They (these three classes) differ in social habits, in the manner of wearing their cloths; in

“the mode of adorning their foreheads; in their fashion of speech; in ceremonial observances, such as temple festivals, household fasts and feasts; in other ways even as to the form of household utensils. At the same time, despite these differences, they possess certain features of resemblance;—all men wear the sacred thread; the private prayers offered up thrice daily are substantially the same; the Vedic ceremonies, monthly and annual, are performed on the same principles.”

94. But difference in India manifests itself in this particular form; and, in truth, such Indian unsociability is not really much greater than that which prevails in Western countries between Protestant and Roman Catholic, Episcopalian and Non-conformist, etc. Certainly in Southern and Northern Ireland the avoidance of intermarriage, and a tacit disinclination to exchange hospitality, are scarcely less noticeable among the members of the two prevailing forms of the Christian religion than among the Indian classes of which mention has been made.

95. The question of theological difference disposed of, arises that of race, to which some reference has been made elsewhere. Difference of mother-tongue, difference of social custom originally induced by climate and locality, are so obvious, that the linguistic division of *Bráhmans* (and of other castes) stands fairly justified as representative of a racial difference. Nowhere can the persistence of this racial difference find a better illustration than in the sharp distinction prevailing in Malabar between *Nambúdrí Bráhmans*, the “indigenous” *Bráhmans*, *Pattar Bráhmans*, who are East Coast immigrants, and are still regarded as such although their period of residence may reach back to prehistoric days, and *Embrándri Bráhmans*, who are of Tulu or Canarese origin.

96. But now arise differences much more puzzling, which find expression in the refusal of intermarriage, though not of commensality, *et vice versa*.

97. *Smártas*, or at any rate those of whom my informant treats, are divided for matrimonial purposes into certain mutually exclusive sub-classes, of which the following will serve as examples:—

- (1) *Brihacharanam*—a sub-class again subdivided into various sub-groups according to locality, e.g., *Kandramánikkam*, *Malainádu*, *Gavarapattu*, etc.
- (2) *Ashtasahasram*—again subdivided.
- (3) *Vadama*—with sub-groups *Vadadésam*, *Chóladésam*, etc.
- (4) *Váttima*—sub-divided into (a) those of a particular eighteen villages; (b) others.
- (5) *Kanjanúr*.
- (6) *Késian*.

98. In the formation of these groups a predominating influence is doubtless that of locality, to which reference will be made in treating of other castes. It is also possible that this extreme endogamy is an offspring of exogamy instituted on sound eugenic principles, but of which the original purport has been entirely forgotten.

99. At the present day intermarriage between sub-groups of the same sub-class is not invariably avoided, nor is such occurrence necessarily followed by social ostracism. But marriage between different sub-classes (e.g., *Vadama* and *Brihacharanam*) does not as yet seem to be permissible.

100. Among *Vaishnavas*, the apparently comprehensible distinction between *Tengalai* and *Vadagalai* is not a bar to matrimony; but to supplement this deficiency distinctions exist, which appear to confound even those affected by them. A convert to *Vaishnavism* for example cannot find a bride among the long-established followers of his new faith; another is rejected because “he is not sufficiently pure”—“whatever that may mean” observes a *Smárta* critic.

101. Of the difference which finds its expression in relation to food, a *Vaishnava* informant cites his own puzzling case, wherein his mother and mother-in-law partake of food cooked by his wife, while neither will touch a meal prepared by the other.

102. Inasmuch as those affected by these distinctions cannot account for them, I can venture no explanation of their origin.

103. Among *Désasthas* (followers of Madhva), *Telugu* does not marry with *Maráthi*, nor, in Canara, *Saraswat* with *Konkani*; wherein we can trace racial difference. Otherwise I have not obtained information as to the existence of clean cut groups; but from a *Désastha* I learn that locality exercises in his community almost as potent a sundering influence as elsewhere.

104. Abandoning *Bráhmans* for the present, we may glance at the subject in relation to some of the great *non-Bráhma*n (Dravidian?) castes of Southern India. Here the potent causes of sub-caste formation are, I should say, (a) difference of locality, (b) difference of occupation. But before considering these influences the question may be viewed from another standpoint. Of this view, indeed, the result is to a certain extent a reflection striking at the general theory which we are endeavouring to elucidate.

105. The custom of the country, and especially of foreigners resident therein, is to use caste names of such all embracing nature as to be practically meaningless. Few caste names are better known than *Vellála*; but at the beginning of this chapter allusion has been made to the well nigh innumerable sub-castes into which the *Vellálas* are divided. From enquiries made of intelligent and educated *Vellálas*, it would appear to me that the cause of this apparent sub-division lies, not in a fissiparous tendency existing in a definite *Vellála* community, but rather in the general application of a quasi-social term to a number of communities, which have little or no connection one with the other. A Western parallel might be the use of the terms "farmer" and "working man;" all farmers and all working men have, it is true, certain points in common; but for practical purposes their divisions are so great as to admit of their separation into a myriad of practically unconnected sub-divisions.

106. The terms *Pillai* and *Mudaliyár*, which, as already observed, were not recognized as caste names because of their frequent adoption by persons of very varying degree, are the favourite affixes of the *Vellálas*. In favour of their recognition it must be admitted that these terms, for all their indefiniteness to a foreigner, have a very definite signification to those who employ them, and are used with a definite connotation in many old records and documents. I enquired of two *Vellálas* of my acquaintance, of whom one styled himself *Mudaliyár*, the other *Pillai*, what was the difference between them which forbade them to eat together or to intermarry: they replied that the question should rather be what was the similarity which would allow them to do so. The fact that both were *Vellálas*, they appeared to regard as of as little significance as the fact that both were Government servants.

107. A chain of reasoning somewhat similar might be applied to the case of the *Náyars*, who in Malabar number some 388 thousand persons. Their divisions, sub-castes, clan, etc., have been enumerated and described by Messrs. Logan, Fawcett, Thurston and others; the reason for these sub-divisions would appear to be that assigned in the Census Report of 1891 by Sir H. A. Stuart, who suggests that a definite *Náyar* community did not break up into a number of mutually exclusive social groups, but rather that numerous communities, between whom no tie or similarity existed, in course of time adopted a general social designation, which has little more precise and definite meaning than the term *Súdra*.

108. A further illustration of this theory can be found in the matter of the *Chettis*; a caste numbering, according to table XIII, over 350,000 souls. But the affix is assumed by traders generally, who may have little or nothing in common beyond the fact of being engaged in trade. Mr. Thurston enumerates some 25 distinct castes or classes possessing distinct caste or occupational appellatives, whose trading members are wont to style themselves *Chettis*. In European hearing the term calls up to mind the *Náttukóttai Chettis*, the great Indian bankers of the south, whose head-quarters are in the Tiruppattúr and Devakóttai divisions of the Sivaganga and Rámnád Zamindaris. Yet strange to say "genuine" *Chettis*, whoever they may be, affect to doubt the "*Chettihood*" of these great representatives of the name.

109. In respect of occupation, however, the banking of the *Náttukóttai Chetti* is sufficiently distinguishable, and distinctive of its followers, from the retailing of the more general *Chetti*. To illustrate the difference arising from difference of locality Mr. Thurston instances several sections of *Madura Chettis*, whose characteristic names in most cases import locality of origin, and have little or no direct connection with their social peculiarities.

110. *Chettis* are widespread, but *Náyars* are definitely associated with Malabar. The local difference between North and South Malabar is definitely marked, and North Malabar sub-divisions of *Náyars* as a rule rank higher than the corresponding divisions in the South. The sub-divisions of the North Malabar *Náyars*, which appear to have a certain local origin, are amazingly complicated; they are described in the Gazetteer of the Malabar district—a work available for those who seek further information on this matter.

111. *Taragan* (broker) *Náyars* of Angádipuram, claiming descent from a high family of Travancore, differ from the *Taragan Náyars* of Pálghát, who for purposes of marriage are confined to their own caste; while some consider *Taragan Náyars* generally to be of different local origin to the Malabar *Nayar* properly so called.

112. Of *Baliyas*, and *Kápus*, I have made some enquiries on this matter. Here too locality and occupation are put forward as the main causes of sub-caste difference. The difference may find expression in refusal of intermarriage, or of commensality, or of both. A *Baliya* correspondent from the Deccan quotes the names of sundry sub-divisions of the caste to be found in the Northern Circars, observing that he considers himself distinct from such people, inasmuch as he has never had, and probably never will have, occasion to mix with them. Another from the Northern Circars puts the case in a more concrete form, when describing to me a visit to Madras City where he met a fellow *Baliya*, and was by him invited to a meal. "Theoretically," said my informant, "the would-be host was an undoubted *Baliya*: practically, he came from a different part of the country, and I felt that we differed. In India this difference finds expression in refusal to eat together—so I refused the invitation."

113. A *Kápu* of the Peddakanti sub-class I found about to undertake a very considerable journey in search of a wife for his son. Asked why the *Kápus* of the neighbourhood, of whom there were a many, would not serve his purpose, he replied that he belonged to a sub-group of his sub-class, whose members traced their origin back to a particular locality, and among such his son must marry. It is interesting to note that there were about him certain families of suitable descent, but they had broken the strict letter of the endogamous law, and intermarried in their sub-class without regard to sub-group: therefore this strict purist would have none of them. It may be suggested that local difference, with the present improved facilities of communication, should no longer carry any great weight. But in the first place those affected by this difference are frequently not in a position to avail themselves, whether from inclination or necessity, of opportunities for travel; secondly a difference obliterated in practice will frequently persist in theory. This latter fact is still more marked in occupational sub-grouping; persons being still differentiated in accordance with professions which they no longer exercise.

114. Such sub-caste difference due to the actual following of different avocations is easily intelligible. As an illustration may be recalled the five occupational groups of the *Kammálans*, of which the goldsmiths, especially in towns, have, as a rule, ceased to intermarry with the blacksmiths. Among the trading *Baliyas* are the *Rálla Baliyas* (traders in precious stones), *Gázula Baliyas* (traders in bangles), *Gonala Baliyas* (manufacturers of, or traders in, gunny cloth); these three eat with one another, but will not intermarry; and will neither eat with, nor marry with, the *Pusala Baliyas*, who are supposed to travel about the country selling beads.

115. It is said that caste sub-division is at times due to the adoption of a degrading occupation by a section of the main caste. The statement is doubtless true to a certain extent, although a doubt is permissible as to whether any considerable

section of mankind has ever deliberately adopted a profession considered by it degrading. The adoption has probably been dictated by force of circumstances ; as an illustration thereof may be instanced the cases of the *Veluttédans*, a subdivision of the *Nâyars*, and the *Kárutigans*, a sub-division of the *Veluttédans*, who have sunk in the social scale, the first by undertaking the work of washermen, the second that of barbers. A still more curious instance is found in relation to *Bráhmans*, among whom those who follow the ecclesiastical calling, described in subsidiary table I to this chapter as the traditional occupation of the community, are held in somewhat small social esteem. This anomaly, and the apparent contradiction of the table just mentioned by subsidiary table VIII to Chapter XII, may be explained by the fact that, if the word "priesthood" be used in its European sense, the *Bráhma*n is not traditionally a priest ; but rather he possesses inherently certain priestly attributes and capacities, of which the regular exercise as a profession, and for a livelihood, is regarded as undignified.

116. But it is probable that the converse of the proposition is more generally true ; and that social differentiation is more often due to the relinquishment of a lowly profession for another of better repute. An illustration is afforded by the *Kammálans* of Malabar, among whom those who have abandoned the smiths' profession in general for the particular branch of the coppersmith are considered to rank above their fellows. Tradition associates the *Shánáns* with toddy-tapping, but a *Shánán*, with whom I conversed on the subject, asserted vehemently to me the superiority of his section of the community, which had abandoned toddy-drawing for agriculture. A similar and entirely natural tendency can be observed in other Indian castes, as well as throughout European society.

117. One more factor in this evolution may be noticed. When all is said and done, the ambition of every Southern Indian, as one of my Indian correspondents puts it, is to be mistaken for a *Bráhma*n, or to be told that he resembles a *Bráhma*n. A society originally homogeneous tends therefore to become disintegrated according to the degree in which its members adopt *Bráhma*nical usages. The pity of the matter is that in lieu of emulation of *Bráhma*n culture and refinement, imitation as a rule takes the form in a lifeless adoption of such social customs as infant marriage, irrevocable widowhood, the purchase of bridegrooms, against all of which educated *Bráhma*n opinion is now lifting up its voice ; of abstinence from meat, which is a mere matter of personal inclination ; of assumed superiority and exclusiveness, which are the failings rather than the virtues of the *Bráhmans*.

CASTE GOVERNMENT.

118. A foreigner observing Indian life, lived in its self-imposed fetters of caste regulation, is apt to exaggerate the potency of these trammels in curtailing individual freedom. Actions, that to a foreigner indicate but a blind uncomfortable bondage to unreasonable and inconvenient social laws, may seem both natural and advantageous to one reared in the environment of such laws.

119. Although remembrance of this fact will frequently suggest a general explanation for some action otherwise inexplicable, it is becoming clear that in modern times there are certain omissions and commissions, which recommend themselves in theory to the orthodox adherent of the caste system, but from which he refrains, at least ostensibly, from a fear of certain unpleasant accruing consequences.

120. Such consequences must have a cause ; penalties, save for offences against Carlyle's "Eternal Verities," do not usually inflict themselves. It is a matter of considerable interest to discover the agency through which punishment for an act, not in the general acceptance of the word, moral or immoral, can be inflicted ; or the tribunal before which an act of contrition and expiation can be made.

121. It is a common phrase to speak of a man being "outcasted." But who "out-casts" him, and how is it done ? At whose hands does the modern Hindu, learned in the *Shástras*, and the civil and criminal law bearing on defamation, experience or apprehend unpleasant consequences arising from a partiality for strange apparel, or forbidden meats and drinks ?

122. The enquiry is also interesting as bearing on the question, already discussed in some of its aspects, as to whether the caste system is breaking down or extending its influence. It is frequently asserted that the facilities afforded to evangelists of reaction by the extension of roads and railways have infused new life into the dry bones of orthodoxy in South India. In proof of this assertion is quoted an increasing, or at least non-diminishing, rigidity of prejudices against inter-caste hospitality, and inter-caste marriage. But, granting that restriction here remain unalterably rigid, although the truth of the statement in regard to "inter-dining" is certainly open to question, I have offered a suggestion in paragraph 38 that a certain exclusiveness in these matters is neither unreasonable in theory nor inconvenient in practice.

123. It has been pointed out to me by an Indian gentleman that the last few years, and especially the occasion of the present census, have witnessed an extraordinary revival of the caste spirit in certain aspects. For numerous castes "*sabhas*" have sprung up, each keen to assert the dignity of the social group which it represents.

124. But assertion of the dignity of a class differs from a detailed and fussy interference with the actions of an individual; and the praiseworthy efforts of these modern associations seem, on the whole, to tend rather in the former direction. This point is emphasized by a writer on the *Kāpus* of Nellore, who states that in the pursuit of the economic aggrandizement and wealth these people care but little for caste rules and caste offences; or that, in other words, offences of the individual committed within caste are ignored, attention being focussed on actions in relation to other social groups, which tend to impair the solidarity of the *Kāpu* community.

125. I circulated through every district a series of questions as to the existence, constitution, and procedure of caste tribunals; the decisions therein arrived at; and the degree of respect paid to such decisions. My thanks for interesting and valuable communications are due to many gentlemen, whose names would form a list too long for detailed mention.

126. Most of my informants agree in thinking that among the better educated, or rather more modernized sections of the population, the formal caste tribunal, with its pains and penalties for individual actions unlikely to affect the community, survives only as an ineffectual tradition. The writer of an elaborate note on the caste government of the *Kanmāḷans*, a community generally accredited with orthodoxy, concludes thus: "Much of what I have written is out-of-date tradition, and not an affair of common knowledge. In several villages, where I sent for members of the community, and asked them for information, a stupid stare was all I got. At *P*, where some came forward as officials of the caste tribunal, they had to compare notes before they could answer my questions. Enquiries of educated and respectable members of the caste, even in Madras, were productive of no result." A writer on the *Vellālas* observes: "No such recognized caste tribunal exists now so far as I know; if one does exist, its authority is very little respected. Caste judgment now amounts to nothing more than popular and informal opinion of a man's conduct."

127. Most striking of all is the consensus of testimony that in the very citadel of orthodoxy, where the trammels of individual action should most survive, there they are found most lacking. There are few things that the high-caste Indian may not do and retain his caste, so long as he remains loyal to the strange (at least in European opinion) system of exclusiveness, devised to keep the outer world from entering within the pale of his community. The "casteman" of modern days exchanges his *dhōti* and *angavastram* for coat and trousers, crops his luxuriant topknot, dilutes his soda, preserves a discreet incuriosity as to the nature of his food and its cooking, modestly refrains from dinning the ears of Heaven with a superfluity of prayers, and the withers of orthodox society remain unwrung. But he must not as yet trample down the sacred fence by a marriage outside his particular fold; or create a possibility of such trampling, by postponing the marriage of his daughter to an age when natural feeling might clash rudely

with abstract principles. One curious attempt in this direction I have encountered in the case of a *Bráhmaṇ*, who married, or at any rate cohabited with, a non-*Bráhmaṇ* woman. Being a rich man and influential man he succeeded in getting the "thread ceremony" of their son performed by a *Bráhmaṇ* priest; and, although this son has not been recognized as a *Bráhmaṇ*, it does not appear that the father suffered any particular inconveniences in consequence of his remarkable act.

128. Such pains and penalties as may be incurred represent rather the tacit verdict of the society amid which the offender lives, than the explicit sentence of a particular authority. Among the Tamil *Smārtas*, I am informed, the presiding authority is the *Guru* of Sringeri; but "his function is rather to enlighten his "flock in spiritual matters, than to interfere in their every-day social organization." I have met a *Guru* of greatest nominal import among Telugu *Bráhmaṇs*; but his responsible advisers admitted some qualms as to the practical deference that would be paid by society to the fiat of a thirteen-year-old child; and philosophically observed that loss of positive power was counterbalanced by the zest which risk added to its exercise.

129. Excommunication then for a *Bráhmaṇ* can only mean the avoidance of his society by other *Bráhmaṇs*. Such avoidance can have two sides; it was quaintly put to me once, when I enquired whether orthodox society had excommunicated X, a notorious heretic, that one might with perfect truth say that X has excommunicated orthodox society. The effectiveness of a social verdict must depend largely on the grounds on which it is based, and the power of society to enforce such verdict. Thus Y ate beef, and drank forbidden liquors, to the scandal of the orthodox; but Y knew the law of libel, and his wealth gave assurance of the aid of trustworthy witnesses. So society bided its time till the occasion of an annual ceremony slipped Y's memory, when the voice of outraged religious opinion could be heard. Whatever inconveniences Y experienced thereby in his life-time I do not know; but his obsequies were a discomfortable matter, inasmuch as no bearers could be found to take his corpse to the burning-ground.

130. P, of rigid and minute orthodoxy, simply made himself a nuisance to his neighbours. On the occasion of a death in his house *Bráhmaṇs* excommunicated him, practically if not in theory, by refusing to attend the funeral ceremonies. P secured absolution by apology, and an undertaking to amend his churlish ways.

131. Q in pursuit of wealth crossed the sea. Having attained it, he found on his return a many candidates for the hand of his daughter. As but one could be chosen, the rejected suitors were fain to excommunicate him. But Q, by sagacious bribery, formed a society which excommunicated the excommunicators, and reconciliation followed a drawn battle.

132. Even on the marriage question, where the exclusiveness of the community is not endangered by union with an outsider, caste feeling appears to be losing the power of effective expression. *Bráhmaṇism* does not unduly put itself about to damn the attendants at a "virgin-widow" marriage, especially if they be rich and influential. Occasionally one hears of a postponement of marriage to something like a reasonable age; a trustworthy informant tells me of a curious case where a *Bráhmaṇ* put away his wife, re-married her, and with her remains in caste.

133. And in a particular case where the existence of a formal governing body is admitted, the writer remarks that the very fact of this formal existence renders caste government a mockery; the caste authorities being mere puppets in the hands of wealthy tradesmen or professional men.

134. Among the higher castes, therefore, the present position of caste government seems to be as follows:—

The formal caste tribunal has disappeared. If in a few cases it survives, and attempts to exercise some function, it is little more than a puppet show working in obedience to the pulling of unseen wires.

A caste verdict is merely the informal opinion of the society amid which a particular person lives.

Such opinion will not, as a rule, be expressed on actions which concern merely the individual doing them, but only on actions likely to affect the society of which he forms a part.

The effectiveness of such opinion depends very largely on the position and influence of the individual affected.

135. Among the lower castes the caste tribunal appears to be a more living organization; and one whose decisions have in themselves a certain possibility of enforcement. Of this there may be one or two fairly obvious explanations.

136. The southern outcast lacks the toleration that education gives; for him the smallest infringement of age-old custom is no light matter; his inappreciation of foreign courts, which transact their business in a form, and frequently in a language, which he does not understand, renders the maintenance of his home-made tribunal for him a matter of every-day necessity. Furthermore, such accounts as I have received of caste government in the stratum of society suggest that here the tribunal is really representative of, or in fact a meeting of, all persons directly interested in the ordering of a small community; its decisions deriving weight from the fact that they represent a verdict of the society amid which the individual affected must get through his life, in most cases without the possibility of change, and with which he must needs be in practical communion.

137. Corroboration of the view that the caste tribunal is concerned rather with the interests of a society, than with the delinquencies of an individual, is derived from another observed fact, which indeed contradicts to some extent the view expressed in the preceding paragraph. In many cases the ultimate adjudication rests with an authority socially unconcerned with the individuals for whom he adjudicates, but for whose propriety of conduct as a social group, his temporal position as the lord of the soil, even though such be now but a memory, or quasi-ecclesiastical superiority, may be supposed to render him in a degree responsible.

138. Thus amongst the *Nambúdris* of part of South Malabar the Rája of Cochin, a *Kshatriya*, is the final authority in caste questions; the Ambadi Kóvilagam is the ultimate head of the *Tiyan* community in the same district; and the *Náyar* overlord of the *désam* is commonly a member of the committees which deal with caste offences among *Tiyans* and *Kumámlans*.

139. Of the *Odiyas* of Goomsur taluk (Ganjám) I learn that, while they possess their own grand inquisitor living at Pechabundi in the Vishnachatram Mutta, the local zamindar appears to be a person of considerable influence in caste questions, in some cases an appeal lying to him from the decision of the caste tribunal. Among the *Dombós* of Vizagapatam the caste headman is appointed by the local zamindar, at whose will the appointment is terminable. In the deliberations of the Kurnool *Kápus* the opinion of the Rája of Gudival is reported to carry, or to have once carried, considerable weight.

140. From North Arcot I have received a report of a *Kápu* caste council, interesting inasmuch as it was held, or the attempt was made to hold it, under the presidency of a *Vaishnava Bráhmaṇ*. The lowly *Málas* of the Ceded Districts are said to acknowledge a *Baliya* as their supreme caste authority—a position recalling the headmanship of a *Kavarai* among the Tamil *Paraiyans*.

141. Again, so far as I have been able to learn by written and personal enquiries, an adverse verdict in respect of caste passed on an individual does not necessarily operate to his prejudice in his relations with members of other castes. A parallel may be found in the verdicts of modern professional tribunals, which may declare a person guilty of infamous or improper conduct with respect to his profession and its members, without conveying any reflection on the propriety of his conduct as a member of general society.

142. From a large number of reports I have selected the following few cases for detailed mention. But, in descending from generalities to particulars, a word of caution is necessary. When a caste is fairly wide-spread, it by no means follows that caste procedure in one district is identical with, or even resembles, that existing in another district.

143. *Khond* or *Játapu*—the terms are synonymous terms according to my informant. The village “*hanta*,” who holds his appointment through a forgotten series of ancestors, rules the village with five assessors. Offences, of which mention will be made subsequently, are adjudicated upon on sworn testimony given by the parties concerned. A man excommunicated by one “*hanta*” can appeal to another: the first “*hanta*” sits with the second, and their decision is final.

144. Allusion has already been made to the caste authority of the Goomsur *Odiyas*, and the *Dombós* of Vizagapatam; the *Behara* among the *Dondasis* of Ganjám lays down caste law to his village. If one *Behara* does not recognize the decision of another, all other *Beharas* boycott him.

145. The offences of which these Oriya tribunals take cognizance are curious. The *Bottadas* of Vizagapatam deal faithfully with social nuisance by outcasting a man who stinks. To be beaten with a slipper is an indignity; but caste feeling is sacrificed to civic patriotism in the excuses made for a *Bottada* urged to *sámán*-carrying by the slipper of a police man. He suffers and is strong in the cause of the State. If a *Bottada* has children by a woman of another, but non-polluting, caste, the children will be admitted to the *Bottada* caste, but not the parents.

146. The *Dombós* of Vizagapatam add insult to injury by excommunicating the luckless wight who is eaten by a tiger.* A *Dombó* assaulted by a *Komati*, *Bráhma*n, *Mangala*, or *Tsákala* falls into disgrace; politeness towards these castes is thus secured.

147. The *Dandásis* of Ganjám are reported to exercise one excellent safeguard of morality. If a man seduces a virgin, and she becomes pregnant, he must marry her. If he refuses, both are summoned before a village meeting. Water is poured on the woman and she remains guiltless; the man is excommunicated for ever.

148. TELUGU CASTES.—Allusion has already been made to their negligence in respect of offences occurring within the caste. A few concrete cases of their action in respect to relations with other castes may be quoted.

149. A *Bráhma*n kept a *Kápu* woman, and had by her two sons and one daughter. The daughter married a *Kápu*, and the bridal pair, together with all the wedding guests, were excommunicated. Subsequently a marriage was planned between the daughter of one of these excommunicated guests and a rich *Kápu*. All the outcastes were re-admitted, and, in course of time, the *Bráhma*n's illegitimate daughter was received into the *Kápu* caste.

150. A *Kápu* of the village *P*, while engaged in a religious ceremony, petted his illegitimate child by a potter woman. He was excommunicated by common consent of his neighbours, and the ostracism continues.

151. *E* of the village *O*, descendant of a long line of *Kápu* headmen, is reported to possess a great and conciliatory influence throughout Bellary, Kurnool, and the Nizam's Dominions. *O* of *K* being suspected of drinking water and eating food given by a *Golla*, his neighbours ceased to associate with him. *E* on his complaint held an investigation, declared him guiltless, and prevailed on society to accept his verdict.

152. Some 100 years ago an ancestor of *N* and *V*, having contracted a doubtful marriage, was ostracised. Being a rich man, he prevailed on *Kápus* of undoubted purity to marry his children. In course of time a small community of such outcasts has grown up, and the efforts of *E* are now directed to securing their amalgamation with the *Kápu* caste.

153. Among *Balijas*, called derisively by the *Kápus* “*Kalalárvandlu*,” or persons troubled about caste, headmen called Chettis take cognizance of such matters as sexual relation within prohibited degrees, sexual relation with a person of right-hand caste, beating or being beaten with a shoe, spitting on or being spat on by

* The idea is probably the same as that noted in Chapter IV, paragraph 88, namely, that the victim either becomes a tiger, or else aids tigers in their ill-doings.

a caste man. But despite the opinion of the *Kápus*, all my informants agree in thinking that here too the authority of the caste tribunal is waning, if it has not already waned.

154. *Málas*, (classed by a high caste writer with "other *Súdras*"), are reported by a Guntúr writer to possess a high degree of caste organization. Each village has its standing *pancháyat*, which is subordinate to a representative assembly of the "*pargana*," while above all is the headman, a *Baija* by caste. The parallel case of the Tamil *Paraiyans* has already been noted.

155. Inseparably connected with *Málas* by ties of mutual aversion, are the *Mádigas*. These latter possess a formal caste tribunal, mostly occupied with *Mála cum Mádiḡa* relations and immoralities. Yet two species of offence with which the tribunal deals are curious, namely, false accusation of a caste offence, and unjustifiable claim to social superiority.

156. In contrast to the Tamil *Kammálans*, their Telugu brethren, the *Kamsalas*, possess a fairly rigorous caste organization. Each village is said to have a committee of five to ten members, nominated by common consent, and permanent. This *pancháyat* communicates with a district committee. At the summit of the community is a high priest living at Badvel and known as "*Sarasvati Pitham*." Under him are subordinate local authorities such as the "*Gáyatri Pitham*" who resides near Bangalore. Succession to these posts is governed by appointment by a predecessor.

157. In Guntúr, there is a district committee for caste affairs. Important original questions are sent up to this body, which sometimes gives its decision at head-quarters, and sometimes sends a member to a village. Appeals lie from the village tribunal to this committee, and thence to the *Pitham*.

158. TAMIL CASTES—*Pallis*.—For an elaborate report on this caste, I am indebted to a Muhammadan informant.

159. The chief authority of the caste is "*Srímat Mahávisésham Ándiyan Brahma Vanniyavamsam Kshatriya Mahámadálayam Ratna Simhásanádhipati Chakravarti Svamiyayógi Sri Agilakontakodi Brahmánandanayóga Srímat Kulandai Ánanda Svami*," whose awful authority resides in the Bhaváni taluk of Coimbatore district. Second in the hierarchy comes the "*Sénathipati*" followed at a respectable distance by the "*Mahánáttán*." No. 1 is named by his predecessor; No. 2 is hereditary; as also No. 3, unless failure of the stock necessitates an election. The jurisdiction of Nos. 1 and 2 is practically universal; that of No. 3 confined to one or two taluks. Further down, each village, which must contain at least five houses of the caste, has its "*Periyathanam*," elected by the villagers over whom his jurisdiction extends, and confirmed by the *magni nominis umbra*.

160. Complaint is made by a person aggrieved to the "*Periyathanam*," who, by means of a messenger, (a low caste person), assembles a meeting. It is characteristic of all fairly rigorous caste organizations that such messenger is no chance newsbearer, but a definite person, generally not of high social position. In his judicial functions the "*Periyathanam*" is aided by a local assessor of respectability; and his findings are circulated to all "*Periyathanams*" in the neighbourhood. A person who refuses to obey a decision is "suspended" from caste; and if obdurate even after a final decision of the higher authorities, is excommunicated.

161. *Concrete cases*.—*A* fined Re. 1 for spitting on a man. *B* "suspended" for taking off his sacred thread. *C* outcasted for cohabiting with a *Paraiyan* woman.

162. In 1908 a case, interesting inasmuch as it involved questions cognizable by a Court, was decided by a caste tribunal. *X* sold land to *Y* and executed a sale deed before the money was paid. Once possessed of this legal document, *Y* would not pay the money due. Ordered to do so by the "*Periyathanam*" he refused whereupon *X* sought the aid of the ineffable name, who ordered *Y* to pay, with an addition of Rs. 21, fine for his dishonesty. *Y* declined to obey, and was totally excommunicated.

163. Yet here too reports have reached me that these old tribunals are losing their effectiveness, and that people resort more and more to ordinary courts of law.

164. *Vellálas*.—Accounts of their caste organization vary from district to district. North Arcot reports it as practically dead; Salem gives a *Bráhma*n priest of Tiruchengod as exercising some authority, and states the following concrete case.

165. A complaint was made by some *Vellálas* that *P* (a widow) lived with a *Koravan*. The widow, who had emigrated to Ceylon, was outside the jurisdiction of the *guru*; but her brothers were fined Rs. 80, and those who had used the same well as the widow, Rs. 200 between them.

166. From Madura a report comes that *Vellálas* are willing to refer their differences for adjudication to any person—even a *Muhammadan*—in whom they have confidence.

167. *Kaikólan*.—In one report a description is given of a somewhat elaborate caste machinery existing among this social group.

168. Each village possesses its *pancháyat* and headman, elected by the villagers, and permanent when approved by the headman of the “*Nád*”, (a committee chosen from some twenty villages), to which such village is affiliated. Of the *Náds*, that of Conjeeveram is supreme. An interesting point noted in this report is that trade offences are not dealt with by this caste committee, but that a common way of dealing with social offences is to stop a man from exercising his trade by placing a seal, (a cow-dung spot), on his loom.

169. *Kammálans*.—Their system of caste government as described by one informant appears to be elaborate in theory, but, as already remarked, the writer is sceptical as to its real existence and authority in these days.

170. Each village has its *pancháyat* presided over by a “*Náttánmai*.” This latter post is usually hereditary, but removals and appointments, if need be, are made by the community. It is interesting to note that the caste *puróhit* is considered as the subordinate of the “*Náttánmai*,” a trace of oriental Erastianism. As to whether or not this *puróhit* is, or may be, a *Bráhma*n, authorities differ.

171. The “*Náttánmai*” convenes a meeting of the committee, and questions are decided by a majority; but the “*Náttánmai*” need not accept nor give effect to a decision, unless it is unanimous. Consequently, if the “*Náttánmai*” disagrees with the majority, he can generally make his views prevail by repeated adjournments and reconsiderations.

172. A curious tradition is given here of a relation between *Kammálans* and certain *Kómat*is called *Pillai Púndavars*, (those who enter as sons). A *Kómat*i shroff of Hyderabad, sentenced to decapitation, was begged off by some *Kammálans*, and out of gratitude he dedicated himself and his family as slaves to his preservers. The arrangement was ratified by the then ruler, who engraved an agreement on a copper plate; and now each *Kammálan* householder pays one-half pagoda to his *Pillai Púndavars*, the idea being that a master should support his slave.

CHAPTER XII.—OCCUPATION.

PART I. (*J. C. Molony.*)

NEXT to, or even surpassing in importance, a knowledge of the Presidency population is a knowledge of the ways in which such population finds the means of livelihood. Imperial table XV in its various parts, table XVI, and the subsidiary tables appended to this chapter, profess to supply such information on the subject as columns 9–11 of the enumeration schedules afforded.

2. The present arrangement of the information obtained differs materially from that employed at the census of 1901. Employment and means of livelihood, though grouped in various classes, orders, and sub-orders, were in the final resort represented then by 520 separate sorts of occupations; actual workers and dependents in each occupation were distinguished, and actual workers still further classified by sex, and according as they depended solely on the exercise of a particular occupation, or combined such occupation with the pursuit of agriculture.

3. The three distinctions last mentioned still persist, but the actual number of occupations has now been reduced to 169. These 169 occupations have been arranged in four “classes,” and twelve “sub-classes,” in accordance with a scheme devised by M. Bertillon to facilitate the international comparison of statistics.

4. The claim of one arrangement or of the other to preference will vary in accordance with the standpoint from which judgment is passed. Diminution of detail is certainly an advantage; the possibility of comparison between the statistics of Indian occupation and those of other countries, which M. Bertillon’s scheme holds out, is at first sight attractive. On the other hand, it must be admitted that statistical comparison is not necessarily identical with practical; and that things cannot be made the same by affixing to them the same general name. It is possible to contrast the representation of “industry” by $5\frac{1}{2}$ million persons in Madras with its numerical representation in France; but for the businessman the question must inevitably arise, whether the content of the term—the only matter of importance to him—is at all the same in the two countries. In particular, it may be queried whether a system of classification, devised for countries where exists a clear distinction between manufacture and trade, and where the processes of manufacture are highly specialized and sharply differentiated, is suitable for Southern India; where, to a very large extent, the native manufacturer (*e.g.*, goldsmith) carries through himself each separate process of manufacture, and then sells the finished product of his industry.

5. To a drawback inherent in change of classification system from census to census attention is invited by my collaborateur; such change may very largely vitiate numerical comparison. For example, different items of spinning and weaving, distinct in 1901, are now clubbed together; with the result that it is impossible to ascertain the *real* numerical expansion or contraction of these occupations between 1901 and 1911. Statistical comparison by proportional adjustment is, of course, possible, but of little practical value, inasmuch as it tacitly assumes the very premiss in doubt—an identity of tendency throughout two decades.

6. *Sed hæc hæcenus.* A word as to the ground plan of this chapter may not be amiss.

7. Long before the order of table XV *et seq.* began to emerge from the chaos of the abstraction office, it was observed to me by a business man that very frequently census statistics and criticisms of industry and occupation are of little interest or importance to a practical man, inasmuch as mere statement of numerical variation, without appreciation of the uncertainty of the actual figures, and without an expert knowledge of the causes which produce such variation, is of small value.

8. The justice of such criticism being self-evident, it was but natural to seek to remedy defect. To supplement a short note written by me on the census figures of Madras city Mr. Alfred Chatterton contributed a chapter on the industries of the capital. He has with great kindness undertaken a similar task in relation to a wider area; and his contribution, which represents in fact an industrial survey of the Presidency by an expert, forms the second section of this chapter.

9. So far as possible we have sought that one work should not overlap. I attempt to treat of the agriculture or agricultural population of the Presidency, and of a few special points, such as occupations of women, suggested by the statistics; Mr. Chatterton confines himself to trade and industry.

10. Treatment of my allotted section is facilitated by the fact that here at least the principle of classification has remained unchanged; landowners, cultivating and non-cultivating, tenants similarly distinguished, and farm servants or agricultural labourers, still constituting the bulk of the agricultural population. In table XV-B, it is true, a division of those dependent on the soil for a livelihood into "rent payers" and "rent receivers" is attempted; but in regard to this Presidency it is of no great interest.

11. One small detail relating to the statistics of agricultural occupation may be explained. This is the description, at first sight nonsensical, in table XV-B, of a certain number of the purely agricultural population as partially agriculturist. The explanation is that such description applies to men or women engaged in agriculture, who carry on more than one species of agricultural occupation. Thus a zamindar, in most cases, a person who draws his chief income from the letting out of his land to others (non-cultivating landowner), frequently carries on a certain amount of cultivation on his own account; and thus ranks in some degree also as a cultivating landowner. Similarly a cultivating tenant may possess other land of his own, which he either cultivates himself or leases out for rent; a farm labourer has frequently his own little plot, over which he is the master.

12. That agriculture is the mainstay of the Presidency, as of India in general, is a fact so well known as hardly to need mention. Of a total population of 41,870,160, ordinary cultivation supports, whether as workers or dependents, 28,621,449, or 6,836 persons per 10,000. From this number, for purposes of comparison with the figures of 1901, may be excluded 74,508 persons concerned with management of estates, rent collection, etc.; when the proportion of agriculturists to the total population will be 6,818 per 10,000.

13. In 1901 there were dependent on agriculture 26,381,813 persons out of 38,623,066, or 6,831 per 10,000 of the total population.*

14. It is questionable whether the very slight movement indicated by these figures is sufficient to justify the drawing of any conclusion as to a decrease in the popularity or possibilities of agriculture. If on the one hand there can be no doubt that industrialism is in the air, and that new fields for the employment of labour and capital are being opened up, there are some considerations on the other side which it is well to bear in mind.

15. The first is the possibility, to which attention has frequently been drawn elsewhere, of inaccuracy in the census returns. In respect of employment there are two factors tending to error; firstly, the popularity or supposed "respectability" of agriculture; secondly, the heredity still associated with calling in India. A man will often give as his profession that followed by his ancestors, or that which custom assigns to his caste, even though he may not actually exercise such calling himself; I can recall to mind a man who always spoke of himself, and was spoken of, as a barber, although, as a matter of fact, he was a money-lender doing a considerable business, and in all probability never handled a razor for hire in his life. On the other hand an individual plying a calling not held in general esteem, should he have any connection however slight with agriculture, is apt to return agriculture as his principal occupation.

* Excluding figures for the Laccadive Islands.

16. Furthermore, in this Presidency, the advancement of industry is bound up with the advancement of agriculture. The country provides its own raw material, the direction of sound industrial development would seem to lie in the handling of what the soil produces. The industrial advance of Madura has been mentioned; with a large increase in the number of ginning factories and in certain taluks of the neighbouring Rámnád district there has been, I learn, a marked increase in the cultivation of cotton and improvement in methods of general cultivation.

Description.	Distribution of 1,000 persons supported by agriculture.	
	1911.	1901.
Non-cultivating landowner ...	34	30
Cultivating " ...	461	512
Non-cultivating tenant ...	6	2
Cultivating " ...	225	167
Farm labourer ...	274	289

17. The "internal" classification of agriculturists may next be considered. Figures quoted in the margin show the distribution of 1,000 agriculturists among the five sub-divisions of agriculture. There are some features of curious interest in this return.

18. The first is a marked decrease in the number of cultivating landowners, and increase in that of cultivating tenants. Without regard to the accuracy of the representation the statistical result is surprising. There were a few questions of classification, (to that of caste reference has already been made), hotly debated when the census-taking being organized; and prominent among them was that occasioned by the conferment of occupancy right on zamindari tenants. Among such tenants there appeared to exist a widespread apprehension that return of themselves as tenants in any form would be prejudicial to their newly established right; and so frequently was the point raised, and with such obvious earnestness, that I personally anticipated the practical disappearance of the tenant class from the returns.

19. These figures, it is true, refer to the population dependent on agriculture, not to the actual workers therein. But save in one instance, the marginal figures for actual workers alone tally with those representing the total dependent population. The exception is the case of agricultural labourers, whose numbers dependent generally on agriculture have decreased by 15 per 1,000, but who, in point of actual workers, occupy practically the same position in relation to the rest of the agricultural community as they did ten years ago.

20. This result is in many ways very curious. In the first place, as mentioned in Chapter II, there is an undoubted uneasiness over the exodus of labour to foreign countries—an exodus which emigration statistics show to exist, and which is probably due to the fact that the Indian employer of agricultural labour, as in the case of other labour mentioned by Mr. Chatterton, has not yet recognized that, to keep his labourer, he must pay him properly, and treat him properly. But these figures appear to show that the proportionate number of employers and employees has not undergone any marked change. If then we grant that there is a shortage of agricultural labour in Madras, at first sight the only possible explanation would appear to be that the pick of the labour goes abroad, that which is comparatively valueless remaining behind. There are some figures which illustrate the point; it is only fair to remark that two different meanings can be read into them.

21. As can be seen from those quoted in the margin, the number of actual workers among 1,000 persons dependent on the earnings of agricultural labour has fallen. This may be taken to denote an increase of prosperity among the labouring class, which relieves a certain

number of women and children, of the aged and infirm of both sexes, from the necessity of working. In point of fact, the decrease among actual female workers

Actual workers per 1,000 dependent on agricultural labour.						
1911	...	...	...	...	...	649
1901	...	...	...	...	...	662

is sufficient to counterbalance practically the increase among the men. But, considering the general circumstances of the Indian agricultural labourer, these figures may also denote a falling off in the number *fit* to work; there being few whose relations can afford to allow them to sit idle if they *can* work.

22. Possibly a better comparison is that between the actual workers in the labouring class, and workers *plus* dependents in other branches of agriculture. To the latter class the *non-workers* among the former may be of no importance; but an adequate supply of *workers* is in the end as important to the dependents of the landowner as to the landowner himself. We find that in 1901 there were 270 working labourers for every 1,000 persons, (workers *plus* dependents), supported by the other four agricultural occupations; in 1911 this number has fallen to 245.

23. A proportional increase of “workers” among non-cultivating landlords may be noted. The term “worker” is in this case inexact; but as evidence of an increasing number of landed proprietors the figures possess some interest. Of more value than statistics as to the subsidiary occupations of landowners, and occupations followed by particular castes, would be information, could it be obtained, as to how far, if at all, the land is passing from the hands of the agricultural to those of the professional or trading classes.

24. An increase in the number of non-cultivating landlords would at first sight imply that it is becoming increasingly worth while for a man to acquire land for the purpose of subletting it to others; and the supposition is strengthened by the gradual increase observable throughout the Presidency in the selling value of land of all descriptions. Yet from information derived from others, and from some small personal observation, I am inclined to think that there is room for doubt as to whether land acquirement by those who have no intention of working the land themselves, is always, or often, a practical commercial transaction. The glamour of land possession is so strong in India, that the wealthy *vakil*, official, or tradesman, will often buy land at a price which precludes the hope of an adequate return on his outlay; surplus cash is in fact invested in a form of security which yields no monetary repayment, but of which the possession lends a certain sense of dignity and pleasure.

25. Table XV-B, which professes to give the subsidiary occupations returned by agriculturists, serves also to show the distribution by districts of the five classes into which the agricultural population has been divided. The figures in some cases correspond with general expectation; in others they appear self-contradictory.

26. Thus, for example, the preponderance of non-cultivating landlords in Tanjore district is not surprising. The district is wealthy; widespread irrigation renders land even at a very high price, a safe “lock-up” for money; and Tanjore is to a large extent the home or favoured retreat of well-to-do lawyers and other professional men. In South Arcot, the existence of a large number of “cultivating landlords,” or “peasant proprietors,” is probably facilitated by the wide spread of groundnut cultivation—a crop peculiarly suitable for the small man. If both sexes be taken into account, it is true that these and subsequent considerations will need revision, but in all probability the male return of occupation is a fairly reliable indication of the conditions of a district.

27. A high proportion of cultivating tenants seems natural in the Northern Circars, where zamindaris abound, and in Chittoor; the supply of agricultural labourers one would expect to follow in the main the demand created by the presence of a large number of possible employers.

28. But some anomalies may be noticed in the returns. It seems doubtful whether Rámnád and Tinnevely could handle their cultivation with the comparatively scanty supply of labour that the figures indicate as there available; the number of non-cultivating landlords in Cuddapah and Kurnool is surprisingly large, if the natural characteristics of these districts be considered, and if the number is contrasted with that found in more favoured localities. In Rámnád one would hardly expect the number of cultivating landlords to exceed so enormously that of cultivating tenants; the explanation may be that suggested in paragraph 18 *supra*.

29. If the particulars given of subsidiary occupation be examined in some detail, it will be seen that non-cultivating landowners in the main follow some other form of agricultural calling. Zamindars and other large landed proprietors apart, the preference given to one form of agricultural employment or the other in the census schedules is probably to a great extent a matter of chance. The entries under the headings "artisans," "priests," and "general labourers," may be attributed to the "inam" system, which, theoretically at least, provides each indispensable unit of village society with a plot of ground for his maintenance. Thus the smith, the *puróhit*, and the *Mála* labourer, have each as a rule some shadowy title to a certain extent of land, and are wont to refer to such as their chief means of subsistence. In reality there is often very little real connection between the nominal owner and his land; I have met many cases where the land had been in the practical possession and enjoyment of others for countless years; the registered owner depending entirely on fees, paid in cash or kind, for services rendered by him.

30. The same preference for agriculture as a subsidiary occupation runs through all the five sub-divisions of agricultural employment. The connection of trade and sundry other occupations with agriculture, for its proper exposition, requires much more careful analysis than table XV-B and subsidiary table V permit. The substantial landholder, who bargains with wholesale merchants for the sale of his produce, and who can hold up his surplus stocks for a rising market, is in a sense a trader, and will often describe himself as such. The poorer agriculturist may run, more or less carelessly, a petty shop in his house, under the control of some junior member of his family, on the off chance of supplementing his scanty earnings; should the needs of his own cultivation permit, he is glad to hire out himself and his bullocks for transport, to plough for a wealthy neighbour, or for raising water from a well. But it is, I think, doubtful whether the real trader or money lender embarks to any great extent on the genuine pursuit of agriculture; he may lend money on the security of land or crop, and keep the farmer practically in the position of his servant; but he will as a rule take very little interest in agriculture *per se*, as distinguished from the profit which he may obtain by entrusting an advance to an agriculturist.

31. Subsidiary tables I to V do not appear to supply much further material for general comment. Their general witness is to the well-known fact that Southern India is well nigh wholly agricultural. Progress or regress in arts and industries I could only treat by trespassing on the preserves of Mr. Chatterton, whose reasoned expositions are obviously of much greater interest and importance than could be my bald and uninstructed statistical comparison of figures.

32. Subsidiary table VIII deals with the occupations of selected castes. It may be read in connection with subsidiary table I to Chapter XI; and its information may be summarized thus. Artisan castes in the main return as their profession that with which tradition associates their caste; other castes, in general, return agriculture as their profession; as do castes to whose traditional calling some stigma is supposed to attach. This last point is illustrated by the statistics of the *Shánáns*, *Tíyáns*, and *Billavas*.

33. The scanty proportion of *Bráhmans* engaged in the priestly calling bears out the suggestion of paragraph 115, Chapter XI, that priesthood is not the profession of the *Bráhman*, if "profession" be understood in its European sense.

34. The weaving castes (*Dévánga*, *Kaikólan* and *Sále*) are, on the whole, faithful to their hereditary calling. The position and prospects of the weaving industry are discussed subsequently; comment is therefore needless at this stage. As compared with other castes it may be seen that trade appears in somewhat special favour with this people as an alternative employment.

35. Tamil metal workers (*Kammálans*) appear to have a much greater partiality for agriculture than their Telugu brethren, the *Kamsalas*. If the figures of this table be compared with those of subsidiary table on the same lines prepared

at the last census, the number of Tamil artisans who follow their hereditary profession appears to have increased considerably, while a considerable decrease is apparent among the Telugus.

36. The Indian Christian is, as a rule, recruited from that *stratum* of society which finds its chief support in agricultural, or general, labour. The return of occupations followed by this community is potentially interesting, as showing the extent to which a change of religion, with the possibilities of education and advancement suggested in Chapters IV and VIII, may have widened the horizon of the convert. But to turn potential into actual information, a much more detailed census taking, and more detailed tabulation of results attained, would be needed than is possible in connection with a general census. It would be necessary, for example, to ascertain the social and material status of the convert antecedent to conversion, the period for which he or his family had belonged to the Christian faith, and the exact meaning to be attached to the occupational term returned.

37. We find that the main professions returned are "cultivating land-owner and tenant," (237 per 1,000); "artisan" (236 per 1,000), and "field and general labourer" (263 per 1,000). The first-mentioned two classes may have been recruited to some extent from those originally belonging to the third: at the same time it must be remembered that one church, (the Roman Catholic), has been decidedly successful in obtaining conversions among the "tenant farmer" class, and that a large number of these converts, whose material circumstances remain unaltered by conversion, are to be found in the percentage of "landowners and tenants." "Artisan" is a term too vague and general to convey definite information—the person so designated, especially in India, may be anything from a highly skilled workman to a mere cooly taking an unintelligent part in some industrial occupation. It is clear, however, that such an institution as the Basel Mission, which combines industrialism on a considerable scale with evangelization, must be doing an excellent work in the imparting of practical technical education to a considerable section of the Indian Christian people.

38. "Lawyers, doctors and teachers" (29 per 1,000) are probably made up for the most part of the Indian catechists and instructors attached to every mission, both in the department of direct missionary work, and in that of secular instruction, which nowadays is the practically invariable concomitant of missionary endeavour.

39. The Anglo-Indians of 1901 who enjoyed "independent means" numbered 13 per 1,000. The fact that, under the designation of "persons living principally on their income," this proportion has increased to 116 per 1,000, is explained by the present grouping under this latter designation of pensioners, scholarship-holders, persons supported by their relatives, etc., all of whom were distinguished ten years previously. A comparison of the groupings will illustrate the dangers inherent in a change of classification: in 1901 the above-mentioned groups of persons, who were not actively engaged in the pursuit of some trade or calling, numbered together 244 per 1,000 of the total Anglo-Indian working population; in 1911 the proportion has fallen to 115 per 1,000—a result which is obviously impossible. It is impracticable to draw a real comparison between these two sets of statistics.

40. Taking those for 1911, as they stand, we find that, excluding "others" (215 per 1,000), the chief stand-by of the Anglo-Indian is the profession of "contractor, clerk, cashier, etc.;" a wide description, but one which probably may be taken as denoting here the subordinate ranks of the mercantile-clerical profession. It was observed to me in this connection by a friend acquainted with the subject that a striking feature of his long experience in the conduct of large business affairs in Madras was the disappearance of the Anglo-Indian from the "upper-subordinate" posts of commerce. This he attributed in part to a prescient desire for security and pension,—prospects afforded by Government employment in certain departments of medicine, police and engineering; partly to underselling by Indian competition. Another informant, who possesses an intimate and disinterested

acquaintance with the subject, has discussed for me this latter aspect of the question. The Indian, he considers, as a clerk pure and simple, excels the Anglo-Indian, and will work at a considerably cheaper rate.

41. In respect to the former point, the proportion of Anglo-Indians in "Public administration" now stands at 61 per 1,000, as against 37 per 1,000 in "Government service" in 1901. But for a proper appreciation of the extent to which the Anglo-Indian is successful in his search for Government employment, it would be necessary to examine in detail the statistics of certain professions exercised, some partly, some entirely, in dependence upon Government. Of such may be instanced, as examples, the telegraph and postal services, which undoubtedly provide employment for many of this race; the medical profession, where, in the Indian Subordinate Medical Department, many Anglo-Indians are found; the survey establishment; and the railway service, certainly a "public service," and one in close relation to the Government of the country, if not under its direct control. This information, unfortunately, the statistics as now compiled do not provide.

42. *Occupations of women.*—Table XV, part I, shows 8,379,378 women, out of a total female population of 21,264,152, as actively engaged in the pursuit of some occupation or other. Reducing everything to a common denominator, we find that 392 women per 1,000 in British territory are "actual workers," as against 538 per 1,000 in the Native States: in these latter a similar preponderance of actual workers among men is noticeable, their figure being 668 per 1,000, as against 627 per 1,000 in British territory.

43. It will be sufficient for our purposes to consider only the women of the British districts. Of the workers there, ordinary cultivation supports 746 per 1,000; and among the cultivators 447 per 1,000 are labourers, and 532 per 1,000 either cultivating landlords or cultivating tenants, the former predominating. In the returns of 1901 we find 8,308,233 women out of 19,362,849 in British territory described as actual workers, and 121,465 of 221,221 in the Feudatory States. Proportionately these figures represent respectively 429, and 549 women, per 1,000 of the total female populations.

44. In British territory 767 women of 1,000 workers depended for a livelihood on ordinary cultivation; and in the internal classification of agriculture 446 per 1,000 were returned as labourers, and 539 per 1,000 as either cultivating tenants or cultivating landowners, the latter outnumbering the former in the proportion of about three to one.

45. So much may be said to the reality or unreality of all these figures, that it is impossible to draw from them any valid conclusion as to an increase or decrease in possibility of employment for the women of the country. The large employment of women as farm labourers for transplanting, weeding, and harvest, is an undoubted fact; a woman may have land registered in her name, whether as *pattadar* under Government or as tenant under a private individual; and in so far as she does her fair share of work, or even more than that, in the departments of agriculture above mentioned, she may be described as a working cultivator. The vital process of agriculture, however, is ploughing, and in India this work is entirely in the hands of men.

46. In the textile industries (order 6); and in such work as basket-making (order 8—wood); in food industries (order 12); and especially in rice pounding; in industries connected with dress and toilet (order 13); in petty trade especially trade in foodstuffs (order 33); a large employment of women is perfectly credible.

47. But in many other departments of labour the position occupied by women must be accepted with some degree of scepticism. In heavy work, such as iron work (order 9), carpentry (a part of order 8), masonry (order 15), the return of female workers means nothing more than that the wives or female relations of the workers have been returned as working at the occupations of those on whom they are dependent, or else give to the workers a general unskilled assistance, which has no intimate connection with any particular trade. Of this latter meaning an apt illustration may be found in the return of 3,187 women shown as actually engaged

in the profession of toddy drawing. A woman employed in this industry may carry toddy pots, or the paraphernalia of the tapper, receive full pots handed down from the tree, hand up pots to the tapper when he starts his climb. But such work is mere general labour, and bears no special relation to the art of toddy tapping. At buildings women may be seen passing up stones, carrying mortar, drawing water for the mixing of concrete, etc.; but a woman is never an actual working mason, if the word be used in its English signification.

48. A more genuine appreciation on the part of the enumerator of what really constitutes occupation is shown in the practical disappearance of women from the ranks of actual workers among village officials. Needless to say women do not in point of fact discharge such duties, but the return under this heading in 1901 was technically justifiable, inasmuch as inam lands for village service are often registered in the names of women, who appoint deputies (*gumastas*) to perform the actual work incumbent on the inam holder.

49. A decrease in the number of women employed as agricultural coolies is not perhaps an unfavourable sign for those who, from these statistics of employment, endeavour to draw some conclusion as to amelioration or deterioration in the position of the women of the country. Extension of employment, which by its nature implies a certain tincture of education, among women is what one would desire to find; but unfortunately the undoubted vagueness of occupational returns renders difficult any proper estimation of the facts underlying the figures available.

50. The profession, which in Europe appears to have afforded the first outlet for women's energies, is that of attendance on the sick. In this country there certainly is no profession in which they could be employed more usefully. Yet if figures alone are to be accepted as a guide, the number of those engaged in this vocation appears to have fallen during the decade. The returns of 1901 showed 4,630 "midwives," and 328 "compounders, hospital matrons, and nurses;" the two returns are clubbed in the present statistics and comprise some 4,006 women (group No. 155).

51. But the classification of 1901 was far more useful, inasmuch as the figures of the second group showed the number of women qualified, according to modern ideas, for the exercise of their profession; these are now swamped in a horde of "midwives," whose general qualifications have been trenchantly described by an authority on the subject quoted in Chapter II.

52. The number of women engaged in the imparting of education appears to have well nigh doubled itself in ten years, if figures are to be trusted. Quite a considerable number of the fair sex (12,110) devote themselves to "letters, arts and sciences," but the fact that practically all such are found under a sub-head which includes "singers and dancers," gives rise to doubt as to whether their profession represents a modern educational development.

53. *Occupations of some particular persons.*—Allusion has been made in Chapter VIII to a drawback which appears to attach to "education" in Southern India; namely that the word too often represents but a smattering of English, which may at best qualify a boy for some wretchedly paid post in Government service, and but too often turns him adrift, unfitted for agriculture or industry, on the overstocked market of literary unemployment. The census abstraction offices, which require temporarily an enormous number of men able to read and write, are a happy hunting ground for these much-to-be-pitied victims of our educational system. A few examples of the occupations followed by individuals there engaged may be quoted—

A—His educational qualifications consisted in having "passed Lower Secondary examination;" and in 1901 he secured a temporary job on Rs. 20 in the census offices. Between 1901 and 1911 he was temporary storekeeper in an Indian workshop, ticket checker on a railway, clerk in a shop, schoolmaster, and tram conductor. In 1911 he returned to the census office to his old position—he was not really qualified for anything better—and he describes his future prospects as "trying for a clerk's post."

B—"Studied up to Lower Secondary." Sorter in 1901. Then clerk in an Indian "Fund" office; tried trading in straw for a year or so; kept accounts for a plumber; and returned to census office.

C—Sorter in 1901. Clerk in a shop. Schoolmaster. Returned to census office.

D—Temporary clerk in railway. Clerk in a European firm. Worked in the Gun Carriage Factory. Went as a clerk to Rangoon. Returned, and after three months of "keeping quiet" got a temporary job in the Ordnance Department. Thrown out of work until the census office opened. Does not know what he is going to do.

E—"Discontinued his studies early, and started as a schoolmaster." After some time joined the census offices of 1901, and after this became a "tally clerk" under a big Madras firm. Lost this owing to ill-health, and started a school. Joined census abstraction office when it opened.

F—Passed middle school examination. For some years worked as a "petty contractor," and then became clerk in a leather shop on Rs. 7. Worked in the census office of 1901. Became clerk at a mine, and went from there to a distillery. Returned to the leather shop, and quitted it for the census office. Taken on again at his old place.

G—"Middle school." An old census hand. Between whiles is a schoolmaster.

H—Gave up his studies, and lived under the protection of his relatives. Worked in the census of 1891, and existed someway till the offices opened in 1901. Then became a fitter in a railway workshop, and after that bill collector for a photographer. Out of work for sometime till the census offices opened.

I—Commenced as a teacher in a Government school in Hyderabad. Left this, and started a private school in his own village. Out of work for a long while, and then a temporary clerk in railway service. Out of work again till census offices opened.

J—Pay sheet worker on a railway. Clerk (Rs. 15) in Public Works Department for a few years; then tried the Forest Department. After this overseer in a fuel depot; then cashkeeper, and subsequently clerk, on a mica mine. Out of work when census offices opened.

K—Private clerk to a postal inspector. Then a vaccinator, and after that a temporary copyist in various Government offices. Joined census office, and had no definite prospect of employment when this job ended.

L—Plague passport clerk, acting village karnam, schoolmaster, unemployed, abstractor in the census office. No particular prospect of employment.

M—Church clerk, then a schoolmaster. Employed in the census office, and has got work as an evangelist.

N—Read up to Fourth form, and discontinued his studies to become a schoolmaster. This failed and he joined the census office. At its closing dependent on his brother—a schoolmaster.

O—Studied up to Fifth form. Temporary clerk in Settlement Department; clerk to a merchant; surveyor; cooly recruiter; municipal clerk; plague passport clerk. Out of employment when the census office took him on.

P—Unemployed before census office opened. Left census office, and wrote from the penitentiary regarding disbursement of arrears of pay due to him.

And so on. These are melancholy tales: perhaps in every country the clerical market is overstocked. But in India it appears to be overstocked with those who could have had no real hope of success when they entered it.

PART II.—INDUSTRIAL OCCUPATIONS. (*Alfred Chatterton, C.I.E.*)

PART I.—GENERAL.

54. For industries to exist there must be raw material to work upon, which may be either of local origin or imported. The finished product of one industry is often the raw material of another. It will be convenient to designate as primary industries those which deal with the products of the earth in their natural state, as examples of which we may cite such manufactures as iron, portland cement, cotton yarn, flour and sugar; reserving the term secondary industries for those which are concerned with the conversion of the output of primary industries into articles which pass into the hands of the consumer or user. Thus the manufacture of machine tools or locomotives, of cotton cloth, of bread or of confectioneries, is in each case dependent upon the products of the primary industries already enumerated.

55. The industrial status of a country is largely determined by the extent to which the primary industries are carried on, and it is the object of the fiscal regulators of most countries to encourage the importation of material in its natural state, and to exclude that which has been subjected to the processes of manufacture, which convert it into partially or wholly finished goods. With this idea Indian raw material is welcomed in the markets of Europe and America, whilst any attempt to establish an export trade in finished products is discouraged by the imposition of heavy duties. Under modern conditions the scale of operation in the primary industries is usually very large, in secondary industries the same tendency to expansion may be seen; but there are important reasons why it is not so fully developed, and all over the world there are certain local needs which can only be met by local industries.

56. The Madras Presidency is almost wholly devoted to agriculture, and, with the exception of a few cotton and jute mills, two or three sugar factories, and a cement works, it possesses no primary industries organized on modern lines, unless such preliminary industrial processes as cotton-ginning, rice-hulling, and oil-milling are included. There is no import of raw material from abroad, except for what may be called secondary industries, and much of this, as well as what is retained in the country of the local produce, is worked up by methods which as yet have been but slightly influenced by the industrial revolution which has occurred in more advanced countries.

57. For the present unsatisfactory state of affairs two reasons may be assigned. (1) The complete dissociation of the intellectual classes in the country from its industries. Manual work of any kind was looked upon as degrading, and the higher castes treated with contempt the artisans and craftsmen who carried on the industrial work of the country. Till nearly the middle of the 19th century India was scarcely affected by the industrial changes going on in Europe. Ocean freights were heavy, and the absence of facilities for transport effectively protected the whole country except in the neighbourhood of the sea ports. Manufacturers in Europe were barely able to keep pace with the growing needs of their own people, and were under no necessity to look to foreign markets; but after the opening of the Suez Canal conditions materially changed. Not only did India become more accessible by sea, but the rapid growth of the railway system opened out the interior to trade; cultivation extended, and a ready market was found for surplus produce; the standard of living began to rise, and the needs of the people could not be fully met by the primitive industrial system of the country; the export trade in raw produce stimulated the import trade in manufactured goods, the Indian markets were carefully studied, and gradually all over the country the local artisan was made to feel the pressure of an altogether novel competition. In the past his wages had been regulated by custom, and in ordinary times he lived in tolerable comfort. Some of the old industries succumbed and are never likely to

be revived, but in others the artizan has managed to struggle on, selling his labour for a gradually decreasing wage. He might have met competition by improving his methods of working, but there was no one to help him. The educated classes were not interested in his fate, and went on their way rejoicing at the gradual decrease in the price of their domestic requirements. One or two leaders more far-seeing than the rest sounded a note of warning, but they were unheeded till recently, when the educated classes began to realize that there was no place for them in the industrial life of the country. Now they are seeking a way into it, but the road is beset with difficulties and progress is very slow. This is especially true of the Madras Presidency, where the second reason for the backward state of its industries operates very strongly. This is the absence of mineral wealth. For nearly a century exploratory work has been going on, but the sum total revealed is very meagre, and there is nothing to justify the hope that in the future discoveries will be made which will alter the present situation. The most important deficiency is coal, of which only a few tons have been mined in the Górávari district; elsewhere none has been discovered. Of iron ores there is a vast quantity, but the bulk is of a low grade, and, in the absence of cheap fuel, is worthless, as it will not pay to export it from the country or to carry it by rail to the coal fields in Northern India. Considerable deposits of manganese ore exist in the Vizagapatam district, and during the ten years ending March 1909, 952,025 tons have been exported. The metallurgical demand for this ore is considerable but not unlimited, and there are other deposits in India which are also of commercial value. Russia and Brazil are the only other countries in which mines of this ore are extensively worked, and during the Russo-Japanese War the Russian exports ceased, with the result that India for a time enjoyed a partial monopoly of the supply, and obtained highly satisfactory prices. Since Russia recommenced exporting manganese ore the demand for Indian ore has materially decreased, and consequently the price obtainable for it. There are also deposits of manganese ore in the Sandúr State in the Bellary district, but very little practical use has so far been made of them. At present prices the long lead to the coast precludes them from being worked at a profit.

58. In the Nellore district there are extensive deposits of mica, which have been mined in a primitive way for a considerable time. The industry can hardly be described as an important one, as during the past ten years the output has been 4,234 tons valued at Rs. 49,64,193. Recently there has been a falling off in the quantity of mica mined, and still more in the price per cwt. obtained for it. Some of the old mines are reported to have been exhausted, or to have reached a depth beyond which it becomes unprofitable to work them at the low prices now obtainable for mica on the European market.

59. The extraction of saltpetre from village earths in various parts of the Presidency was at one time an industry of considerable importance. It is still carried on to some extent, chiefly in the Coimbatore district, and gives employment to 490 people. The returns for the past ten years show a production of 6,833 tons valued at Rs. 13,64,689. It is doubtful if these are very accurate, as the exports from the Presidency are extremely small, and all the saltpetre manufactured is apparently for local consumption, either for the manufacture of gunpowder or for manure.

60. Magnesite of great purity exists in the Chalk Hills of Salem, but efforts to put it on the market have not met with much success. Diamonds have been found and are still occasionally found in the Ceded districts, but the matrix from whence they came has never been discovered. There are extensive old workings in the Banganapalle State, and recently some attempt has been made to see if there are any left, but so far with no great amount of success. Old gold workings are numerous, and a vigorous effort is now being made to exploit the reefs of gold-bearing quartz in the Anantapur district with considerable prospect of success. Other minerals, such as corundum, have been found in several districts, and mention may be made of the monazite sands in the extreme south of the Peninsula which are at present of considerable value as a source of thorium. Of many metals traces exist, and specimens may be found in the mineral collections of the Madras Museum, but nowhere do they exist in payable quantities. As a basis of industry

the mineral wealth of the Presidency is a negligible quantity. In regard to building materials, there is a superabundant supply of hard gneissic rock over the greater part of the country, fairly good slate and laminated limestone in the Ceded districts, in places sandstone suitable for building work but nowhere any variety of super-excellence. Clays suitable for bricks of high quality or for tiles are only found on the West Coast, and elsewhere the products of the brickfields and tile factories are of inferior quality.

61. The area of reserved forest is nearly 21,000 square miles, and the Forest Department supply yearly more than 21,000,000 cubic feet of fuel, and 3,500,000 cubic feet of timber, besides bamboos to the number of nearly 40,000,000. There is also a considerable area of privately owned forest land, which probably yields proportionately a larger amount of produce. The quantity of wood brought into Madras for fuel averages 110,000 tons a year, of which fully 90 per cent. is derived from privately owned plantations. There is no doubt that the forests are potential sources of supply, which can meet much larger demands than have ever been made on them, provided they are systematically worked for the industrial needs of the Province. The distillation of wood, and the conservation and utilization of the bye-products, might give rise to an industry of considerable magnitude. The Madras Forest Department obtains a gross revenue of more than 16 lakhs of rupees a year from minor forest produce, but the bulk of this is obtained by fees for fodder and grazing, and the only article of any considerable industrial importance is Tungédu or Avaram bark (*Cassia auriculata*), of which about two lakhs worth is collected every year and used in the local tanneries.

62. Since the mines and forests yield so little, the cultivation of the soil is the principal source of raw material for such primary industries as exist in Madras. The agricultural products of the Presidency are many and varied, and whilst some are put on the market without undergoing any industrial processes, others are subject to treatment which gives rise to industries mostly of a very simple character, although of considerable importance because the scale of operations is large.

63. The following tabular statement, extracted from the "Season and Crop Report" for 1910-11, shows in detail the area devoted to each of the crops grown in the Presidency which is subjected to preparatory processes of an industrial character before it is put on the market :—

		Area, 1910-11. ACRES.			Area, 1910-11. ACRES.
Classification of area—			Acreage under crops—cont.		
(1) Forests	...	13,606,994	Sugar—		
(2) Net area under cultivation ..	...	33,751,813	Sugarcane	...	94,879
(3) Irrigated from Government and	...		Palmyra	...	88,740
private canals, tanks, wells and	...		Fibres—		
other sources	...	9,922,954	Cotton	...	2,317,045
Acreage under crops—			Jute	...	...
Cereals—			Rubber	...	4,420
Rice	...	10,754,010	Dyes—		
Oil-seeds—			Indigo	...	81,464
Linseed	...	14,131	Drugs and narcotics—		
Gingelly	...	815,100	Coffee	...	49,097
Groundnut	...	934,135	Tea	...	16,737
Castor	...	497,823	Tobacco	...	218,315
Cocoanut	...	543,112			

64. The figures from Government villages are fairly accurate, those for zamindari villages are at the best approximations. It is only since 1907-08 that the zamindari villages have been included, and it is a matter of regret that the information regarding them has not been furnished in separate statements. Not only is comparison with previous figures now impossible, but the total figures for the Presidency in each year are made up of two returns, one of which is accurate, and the other only an approximation. Whilst deductions from the figures for Government villages can be made with tolerable certainty, the addition of the zamindari figures introduces an element of uncertainty and permits only of very broad and marked changes being clearly recognized.

65. The area under cultivation has expanded; also the area under irrigation, but to what extent is not accurately known. The following is a list of the more

important vegetable products which have to be subjected to preparatory processes before they are fit to be put on the market, though in some cases they are exported in their raw condition and subjected to these preliminary operations in the countries which import them : paddy, oil-seeds including linseed, gingelly, groundnut, castor and cocoanut ; sugar, whether extracted from cane or palmyra ; cotton, jute, rubber, indigo, coffee, tea and tobacco.

66. The industries to which these products give rise will be discussed in some detail later on. Here, it is only necessary to point out that during the past ten years the industrial tendencies in the Madras Presidency have mainly exhibited themselves in the supersession of hand labour by machinery driven by power derived from steam or internal combustion engines. The main factor has been the development of the use of the internal combustion engine, which enables small quantities of power to be generated both cheaply, and by methods which require no great amount of technical skill to supervise. In the deltaic districts of the Gódvári, Kistna and the Cauvery, which are almost wholly given up to the cultivation of paddy, the primitive methods of husking by hand have to a large extent been superseded by modern machinery. As the result of measures deliberately taken by Government, there has been a similar application of motive power on a small scale to the raising of water for irrigation ; and finally as the result, partly of direct Government assistance, and partly as the result of progressive private effort, a number of what may be termed rural factories have come into existence, which use machine processes usually on the smallest scale that it is practicable to employ them. Such factories employ machinery for ginning cotton, crushing sugarcane, extracting palmyra fibre, pressing oil-seeds, and cutting timber. In the towns power is similarly being employed in an even more varied manner ; as will subsequently appear when we come to discuss the development of the distribution of energy by electrical methods.

67. For the purposes of this chapter the information collected on the night of the census which is embodied in table XV-A of the Provincial Summary is made use of. From this table, extracts have been prepared which deal only with industrial occupations—*vide* table I appended. The total number of people so engaged is 2,075,709 or 5·01 per cent. of the total population. Owing to changes in the method of classification, a comparison with the figures in the census of 1901 is only possible in a certain number of sub-classes ; and even in the broader divisions of classes there has been some transfer of sub-classes. Taking these figures as a basis for discussion of the industrial progress of the last ten years, we find that the occupation tables in a broad way reveal the effect of the developments going on in certain directions, and because they exhibit the anticipated results very clearly in instances which can be verified, they inspire confidence in their indications in cases which cannot be corroborated by other sources of information. We know that there has been, during the period under review, a strong movement in favour of the use of machinery for hulling paddy and cleaning rice, and this fact is reflected in the figures for rice pounders (group 56), who have decreased from 167,956 in 1901 to 125,674 in 1911, or by 25 per cent. Equally it is certain, from the returns regarding the consumption of yarn, that hand-loom weavers have improved their position slightly during the decade ; though it is not possible to demonstrate this from the census returns, owing to the fact that the hand industry is now classed with a number of other branches of the cotton trade in group 22—cotton, spinning, sizing and weaving. The returns show that there has been a material falling off, since the numbers in 1901 were 623,783 and in 1911, 530,321, or a decrease over the whole group of 6·9 per cent. But it is probable that the whole of this occurs amongst the hand spinners, of whom there were 65,870 registered in 1901. The industry is now for all practical purposes extinct, and it is only likely to be returned as an occupation by a few old women. The almost complete elimination of the hand spinners from the returns would justify the assumption that there has been no change in the numbers engaged in the hand-loom industry. The increased outturn of the same is due to improvements in methods of working. Again, the falling off in the leather workers (group 33), who numbered in 1901, 50,795 and in 1911, 37,028—or a decrease of 27 per cent.—is accounted for by the high prices

which the raw material now realizes in the export trade, the increase in the value of which during the ten years has been 38·4 per cent.; in consequence of which ryots have in recent years largely taken to using iron buckets in place of leather for the numerous mhots employed in lifting water from wells for irrigation. The increase in the number of silk weavers, (group 27), may be taken as an undoubted indication of a growing demand for more costly wearing apparel, and a sign of increasing wealth and prosperity among some sections of the community. This conclusion is further substantiated by the not insignificant increase in the numbers of the artisans and craftsmen who flourish when the community has money to spend on something more than the bare necessities of life; whilst the whole population has increased by 3·3 per cent. the number of silk weavers and spinners has increased by 21 per cent., jewellers by 15·6 per cent., tailors by 18·7 per cent., carpenters by 11·6, cabinet-makers by 134 per cent. and printers by 46·5 per cent.

68. An attempt is made for the first time to obtain information regarding the amount of power used in the mills, factories, and workshops; and though the returns are not quite complete, since there was no compulsion to furnish the information, yet they are very valuable as positive evidence of the present position, and supplemented by information obtained from the Inspector of Steam-Boilers and the Director of Industries, it has been possible to ascertain with a fair degree of precision the extent to which mechanical engineering and modern methods of generating power have been called in to assist hand labour.

69. The following statement, compiled from the returns furnished by the owners of factories, and from information specially collected from various sources to fill in gaps which were known to exist, shows the number of brake horse-power or indicated horse-power applied to various industries.

In respect to railway workshops the information furnished in the returns is very incomplete. The principal locomotive shops and carriage building sheds are situated at Perambore, Negapatam, and Podanur. There are also numerous smaller repair shops and running sheds where power is employed.

70. Appendix II shows the same information distributed among the districts of the Presidency, whilst appendix III, which has been specially compiled in the office of the Director of Industries, gives all the information available regarding the application of power to the lifting of water for irrigation. From these returns it will be seen that the bulk of the power is still generated by steam-engines, but that internal combustion engines, whether using oil or gas, are rapidly coming into favour; and it may be anticipated that ultimately they will be universally employed, except possibly for very large units of power such as are required by cotton mills, or in certain industries in which the use of steam power possesses special advantages; as, for instance, in rice mills, where the paddy husk can be conveniently used for generating steam, but is not suitable for making gas, and in sugar works; where large quantities of steam are required apart from power generation, and where in the refuse of cane crushing there is a large amount of fuel which can be conveniently burnt in boilers.

71. The statement of paragraph 69 has been prepared from information supplied by the Inspector of Steam-Boilers. Under the Boiler Act every steam generator working under pressure has to be licensed, and the information under this head may therefore be regarded as complete. It is not known however on what basis the horse-power of the boilers inspected has been calculated. From this statement it will be seen that the total horse-power of the steam-engines is 26,101, whilst the total horse-power of the boilers is 44,613. The difference is considerable but is easily accounted for—

(1) It is known that the list of steam-engines is incomplete; no return, for instance, has been furnished by the Anantapur Gold mines where a boiler capacity of 820 horse-power has been licensed.

(2) The boiler capacity in most power plants is usually in excess of the engine power, so as to permit the boilers to be cut out in turn for cleaning purposes or repairs.

(3) In a variety of industrial operations steam is required for other than power purposes.

Making allowance for these items it may be assumed that the returns for engine power and boiler capacity agree tolerably well.

72. It may here be convenient to give in a tabular form a statement showing the total consumption of fuel in the Madras Presidency year by year under the following heads :—

Year.	Coal in tons.	Wood from Government forests in cubic feet.	Liquid fuel in gallons.
TOTAL ...	3,674,382	194,344,521	3,039,018
1901-02	276,089	14,920,279	
1902-03	208,444	17,981,992	
1903-04	230,298	16,927,342	
1904-05	337,779	17,861,005	
1905-06	331,002	19,047,180	260,205
1906-07	358,941	21,448,576	276,744
1907-08	425,968	22,563,872	350,218
1908-09	517,172	21,196,408	745,288
1909-10	532,491	19,140,625	563,897
1910-11	456,188	23,257,242	842,666

Note.—Figures for imports of liquid fuel are not given in the trade returns prior to 1905-06.

73. It may be assumed that the whole of the coal consumed in the Presidency is for the purpose of generating steam, and that the greater part is used on the railway systems. The figures for wood relate only to Government forests, and an unknown but a very large amount is also obtained from private plantations, chiefly on zamindari lands. On certain sections of the railways large quantities of wood are still burnt in the locomotives. The bulk of the steam power generated in the Presidency is in factories at no great distance from the railway, and coal is more largely consumed than might be expected, chiefly owing to the difficulty entailed by the imperfect transport arrangements in connection with the fuel supply from the forests. The bulk of the wood obtained from the forests is used for domestic purposes, and the increasing consumption serves to strengthen the contention that the material condition of the people is steadily improving.

74. Information regarding the importation of liquid fuel is only available for the last five years under review. It is partly used to make gas for lighting railway trains, but the greater portion is now employed to generate power in the oil-engines to which attention has already been drawn. Under the conditions prevailing in the Madras Presidency, where fuel of any kind is expensive, the internal combustion engine on account of its very high efficiency, especially in engines of small power, is already very largely employed, and is likely to become in time almost the sole source of power. It is not improbable that the development will be chiefly in the direction of gas plants using wood as fuel. It is certainly desirable that it should be so, as the forests can probably be made to yield about ten times as much fuel as they now do, whilst any other fuel must be obtained either from other provinces of India, or from other parts of the world. Coal comes chiefly from Bengal, either by rail or sea, although the Singareni coal field is now much more favourably situated for supplying Madras; but unfortunately most of its output goes west to serve the demands of Hyderabad and Bombay. Owing to the necessity for storing it in bulk, the supply of liquid fuel is at present a monopoly of the Asiatic Petroleum Company. Away from Madras, and especially in the neighbourhood of the forest tracts, suction gas plants worked either with wood or charcoal are undoubtedly the cheapest methods of generating power, and the tendency at the present day is to use oil engines for small units of power and gas-engines for large.

75. But very little use is made of water power. There are two large installations—one at Ambásamudram in the Tinnevely district, where the water power is employed to drive a cotton mill, and the other in the Nilgiris where a hydro-electric station has been put up to supply power to the Government Cordite Factory at Aruvankád. Without storage works there can never be any large development of water power in this part of India, as even in the big rivers the hot weather supply becomes insignificant. The most important potential source of water power is at the outlet from the Periyár lake, where it is contended that, by a slight modification in the present system of supplying water for irrigation, 20,000 horse-power could be made available for industrial purposes, and would be readily taken up at Madura. Electricity still plays a comparatively unimportant part in the industrial life of Southern India. In the city of Madras there is a central generating station with a maximum capacity of 3,890 kilowatts. There are also a number of small private installations chiefly to supply current for electric lighting and driving fans. Mention has already been made of the hydro-electric station in the Nilgiris, and besides that there are a few lighting plants in different parts of the Presidency. Two have been set up at the railway junctions of Tanjore and Trichinopoly. There are a few private installations, and most of the mills have installed a dynamo to supply the electric lighting necessary. The advantages of an electric supply are fully appreciated in Madras, and in many of the mufassal towns there is an opening for development in this direction, with gas or oil engines to drive the dynamos, and an overhead system of distribution. That much has not been done is probably due to the general prevalence of the idea that it will only pay to start work on a much larger scale than that for which capital is forthcoming.

76. *Trade.*—The following tabular statement shows the way in which the external trade of the Presidency has developed during the past ten years :—

Year.	Sea-borne trade.		Coasting trade.		Rail-borne trade.		Total.	
	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.
	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.	RS. LAKHS.
1900-01	662	1,175	727	505	757	792	2,146	2,472
1901-02	773	1,185	660	470	685	592	2,118	2,472
1902-03	720	1,311	527	492	572	648	1,819	2,451
1903-04	751	1,509	511	490	681	629	1,943	2,628
1904-05	845	1,478	554	503	884	694	2,283	2,675
1905-06	777	1,560	635	530	1,082	776	2,494	2,866
1906-07	907	1,748	724	538	1,139	827	2,770	3,113
1907-08	1,025	1,877	671	589	1,121	868	2,817	3,325
1908-09	1,155	1,826	781	567	1,083	907	3,019	3,300
1909-10	946	1,952	1,016	493	1,060	891	3,022	3,336
1910-11	1,064	2,108	914	517	1,025	921	3,003	3,546

77. The principal feature has been the general rise in prices of food-grains, due to the operation of causes affecting, not India alone, but probably the whole of the world. From 1892 to 1900, a period of eight years, second-sort paddy could be obtained in Madras at an average rate of 18 measures per rupee. During the last four years the average rate has been 12 measures per rupee, or an increase in price of 50 per cent. This has of course been greatly to the advantage of the land-owning and cultivating classes, who have profited to a large extent at the expense of other sections of the community, but in so far as higher prices have been realized for many of the staple articles in the foreign export trade, the Presidency as a whole has benefited at the expense of the consuming countries.

78. The following tabular statement, extracted from the sea-borne trade and navigation returns, gives the average prices obtainable in the three years, 1900 to 1903, and in the three years, 1907 to 1910; and in the last column is shown the percentage of increase which is very important in the case of hides, skins, rice and coir—four of the most important articles exported from this Presidency :—

	Average price, 1900-03.	Average price, 1907-10.	Percentage of increase.
Coffee per cwt.	49.52	46.33	- 6.44
Paddy „	2.56	3.45	34.8
Tea per lb.	0.633	0.656	3.66
Oils per gallon	1.426	1.506	5.61
Cotton per cwt.	26.7	28.32	6.31
Raw skins per cwt.	85.97	108.53	23.90
Tanned skins per cwt.	141.52	199.34	40.80
Tanned hides „	55.78	77.07	38.40
Seeds per cwt.	6.51	7.27	6.75
Rice „	5.32	6.35	19.35
Coir „	9.43	10.73	13.80

79. The import trade has grown *pari passu* with the export trade, and, although values have also risen, the advance in the price of manufactured goods has been small, compared with that which has obtained for nearly all the important items of produce exported. The result has been to improve materially the relative status of the agriculturist compared with the manufacturer, whether the latter be working in the country or abroad. The chief feature of the past ten years has been the development of industrial enterprise on a small scale, as exhibited by the establishment of small factories supplied with power to do work which was formerly done by hand. That this will continue to develop there seems to be but little doubt, as the high price of the staple foods grown in the country involves a corresponding rise in the wages of the working population, and rates are now so high that in almost every instance, if the scale of working be only large enough, the introduction of a power plant is invariably attended with considerable economy.

PART II.—DETAILS REGARDING SOME INDUSTRIES OF THE MADRAS PRESIDENCY.

80. The following notes on the principal industries of the Madras Presidency contain a brief summary of the information available regarding their development during the past ten years.

Aluminium industry.—Working in aluminium in India was first started at the Madras School of Arts at the end of March 1898, and in the course of a few years a considerable business was worked up which was transferred to a private company in September 1903. This company, which is known as the Indian Aluminium Company, has now a paid-up capital of Rs. 6,80,000, and it has successfully developed a large business, and possesses very completely equipped workshops in which the manufacturing operations are carried on by the most modern processes available for working in ductile metals. The following table shows the imports into India during the seven years ending April 1911 :—

Year.	Bombay.		Madras.		Cocanada.		Total.	
	CWT.	RS. LAKHS.	CWT.	RS. LAKHS.	CWT.	LAKHS.	CWT.	RS. LAKHS.
1904-05	..	...	890	1·05	...	...	890	1·05
1905-06	188	0·25	1,615	1·81	...	...	1,803	2·06
1906-07	429	0·71	1,535	2·18	...	...	1,964	2·89
1907-08	1,126	1·73	1,570	1·89	...	...	2,696	3·62
1908-09	1,158	1·03	2,275	1·91	301	0·27	3,734	3·21
1909-10	5,373	4·04	4,477	3·46	1,898	1·52	11,740	9·02
1910-11	7,875	6·38	2,336	1·78	1,573	1·08	11,784	9·24

81. The large imports into Bombay are due to the establishment of factories working on somewhat similar lines to that of the Indian Aluminium Company, but the imports into Cocanada are wholly worked up for sale by a large number of small hand working factories which have grown up in Rajahmundry, Ellore, Bezváda, and other towns in the Northern Circars. The very rapid growth during the last two or three years is due to the low price at which the raw material in the shape of ingots and sheets can now be obtained from Europe and America. Aluminium vessels are consequently cheaper than those made of brass and copper, and the demand is steadily increasing.

82. *Brick and tile-making.*—The number of persons engaged in this industry in 1901 was 9,337, and in 1911, 11,229—an increase of 20 per cent. In Madras, and in the districts of South Canara and Malabar, there are a number of factories engaged in this industry, but elsewhere it is carried on in the very primitive fashion to meet the immediate local needs. Only on the West Coast are suitable clays to be found, and the modern development of the industry is due to the enterprise of the Basel Mission. Foreign exports, chiefly to Ceylon, average slightly over one lakh of rupees per annum, whilst the coasting trade, largely to Bombay, ranges between six and seven lakhs of rupees per annum. From appendix II it appears that there are 23 factories employing power, and in addition there are a considerable number in which all the operations are carried on by hand.

83. *Cotton.*—The cotton trade in its various branches employs more capital and gives employment to a larger number of people than any other industry carried on in the Presidency. The following statement shows the area on which cotton was grown during the last ten years, also the weight and value of the cotton exported :—

Year.	Area under cultivation in acres.	Export of raw cotton.	
		Quantity in tons.	Value.
			RS.
1901-02	1,351,200	20,558	1,12,01,272
1902-03	1,580,900	35,826	1,63,21,810
1903-04	1,665,000	44,956	2,56,52,392
1904-05	1,755,000	37,710	2,53,62,760
1905-06	1,802,899	40,023	2,28,90,047
1906-07	1,742,416	34,019	2,21,43,742
1907-08	2,159,567	52,620	3,39,10,066
1908-09	1,959,015	41,056	2,33,43,571
1909-10	2,028,538	47,169	3,18,17,443
1910-11	2,317,045	48,699	4,14,18,813

84. In 1901 there were 24,089 people engaged in cotton-ginning, cleaning, and pressing, and in 1911, 32,553—an increase of 35·1 per cent. During the period there has been a large increase in the amount of ginning done by machinery, and a corresponding decrease in hand-ginning. The marginal table shows the distribution of ginning factories and cotton presses throughout the Presidency, but it is admittedly incomplete, as there are now a considerable number of small factories employing two or three gins driven usually by oil-engines, from which no returns have been received.

85. Through the operations of the Agricultural Department, chiefly by the establishment of seed farms, considerable improvements have been effected in the quality of the cotton grown in certain areas, but the most noteworthy development is in connection with the cultivation of a species of an American upland cotton known as Cambodia cotton. This crop grows best on garden land, as it requires occasional irrigation. The yield is very large and of high quality, and so far it has proved an extremely profitable crop, with the natural result that its cultivation is increasing with extreme rapidity. It is estimated that the outturn in 1911 was not less than 25,000 bales of 500 lb. each. Of the cotton grown in the Presidency, part is manufactured into yarn in the local mills, and the balance exported. The trade has been steadily growing in importance, and has now reached very large dimensions, as shown by the following figures which relate to the exports for 1910-11 :—

86. Cotton spinning.—Hand-spinning is still carried on as a cottage industry in some remote parts of the Presidency, but it has long ceased to be of any commercial importance, and is now merely a relic of an industrial system which has passed away. The mill industry in Madras as compared with Bombay is not highly developed. The following statistics show the progress which has been made since 1881.

Statement showing progress of the mill industry since 1881.

Number of	1881.	1891.	1901.	1907.	1908-09.	1909-10.
Mills	3	8	11	11	11	12
Looms		555	1,735	1,748	1,962	2,023
Spindles	48,000	173,000	288,000	308,000	319,000	339,500
Hands employed daily	1,400	5,900	12,600	16,740	18,030	18,860

87. From this it will be seen that the number of power looms at work in the Presidency is small, and the weaving trade is still mainly carried on with hand-looms. Appendix V to this chapter has been compiled with a view to ascertain the quantity of yarn consumed in the hand looms in this Presidency. The yarn used in the Presidency is either of local manufacture or imported. As the amount of yarn spun by hand may be neglected, the output of the spinning mills furnishes exact information as to the quantity of yarn manufactured. The imports are either direct from foreign sources of supply, or by coasting steamers, which carry both Indian yarn and foreign yarn originally imported into other parts of India. The rail-borne traffic includes both Indian yarn and foreign yarn imported mainly from Bombay. The sum total of these figures furnishes the quantity of yarn brought into the Presidency each year. The table also shows how this yarn is disposed of, partly by foreign export trade, partly by coastal trade to other parts of India, and partly by rail-borne trade across the land frontiers. The returns from the weaving sheds give the quantity of yarn consumed by the power looms, and the balance is the yarn worked up by the hand-looms.

88. An examination of this table in detail shows a large but irregular development of the export trade in coarse yarns, together with a big increase in the importation of foreign yarn, which is mostly of counts higher than those spun in Indian mills. In the three years from 1900 to 1903, the hand-looms used 171,935,000 lb. of yarn ; whilst in the three years from 1907 to 1910 the quantity taken was 179,572,000 lb.--an increase of 4·5 per cent. This by itself would indicate some slight retrogression of the hand-loom industry, since the population during the same period has increased by 8·3 per cent. ; but if account be taken of the fact that between the periods 1900—1903 and 1907—1910 the increase in the foreign yarns consumed in the Presidency amounted to 52 per cent., it will be seen that there has been a considerable amount of progress. The substitution of fine yarn for coarse means much extra work for the hand weavers, and a proportionate increase in the value of their outturn.

89. From information furnished in the Statistical Atlas of the Madras Presidency it appears that in 1900 there were 167,806 hand-looms in the Presidency distributed through the districts as shown in the following table :—

District.	Number of looms.	District.	Number of looms.
Ganjám	10,320	Salem	16,341

South Arcot	6,964		
North Arcot	9,751		

90. No recent attempt has been made to estimate the number of hand-looms in the Presidency, but it is not probable that there has been any great change in the numbers. Through efforts fostered by Government there has, however,

been a marked development in the use of the fly-shuttle slay, which increases the output of each loom on an average by not less than 50 per cent. All over the country in small numbers weavers may now be found using this type of hand-loom, but on the East Coast in the Northern Circars the transformation has been on a big scale. Recently Government deputed a special officer to investigate the matter, and in 89 villages 6,528 fly-shuttle looms were actually counted. It is estimated that the total number is not less than 10,000, and indeed it is put at a very much higher figure than this by merchants engaged in the trade. A review of all the evidence available leads to the conclusion that the hand-loom industry is holding its own, and that the general increase in prosperity is leading to an increased demand for its finer products. This is borne out by the marked increase in the number of hand-loom weavers in such centres of fine weaving as Kumbakonam and Madura. In the former town the increase has been from 465 to 1,824, and in the latter from 9,353 to 15,117, the average increase in the two being 60·8 per cent.

91. The condition of the hand-loom weavers is generally assumed to have steadily deteriorated owing to the effect of competition, and of indirect evidence there is plenty in support of this idea. The weavers themselves complain that their condition has steadily become worse, that they have to work harder and that now the coarse weavers, even by the most unremitting toil, are only able to make a bare livelihood. The present census is the fifth that has been taken, and if the classification of the returns had been uniform throughout it would have been possible to state definitely whether the number of weavers was increasing or decreasing; but unfortunately there have been many changes in the methods of grouping trades or branches of a trade at each census, and it is difficult to arrive at any certain conclusion. The following tabular statement has been compiled to show what comparable returns are available since 1871 regarding those employed in the more important branches of the cotton trade:—

—		—		1871.		1881.		1891.		1901.		1911.	
Cotton-ginning, cleaning and pressing.	} Mill Hand	...	} 24,714	...	...	} 15,041	1,961	} 12,643	1,824	} 20,067			
		24,714		15,041	10,682		18,243						
Cotton manufactures.	...	...	...	188,157	...	...	...	...	...	...			
Cotton-spinning and weaving.	} Mill Hand	...	...	...	...	} 7,306	6,851	6,851	...	16,615			
Spinners ...		...	...	...	7,306		6,414	6,414	...				
Weavers .	Hand.	...	376,561	196,610	...	365,112	...	383,132	..	368,509			

92. From an examination of this table it is clear that in 1871 there were 376,561 weavers (males), but in 1881, 188,157 males are returned as cotton manufacturers, and the weavers only number 196,610. The total comes to 384,767, and probably includes cotton-ginners and cotton-spinners. We may assume approximately that these numbered about 20,000, and that therefore the number of weavers in 1881 was slightly over 360,000, showing a probable decrease of 15,000 weavers in the ten years. This result would not be unexpected remembering the havoc caused by the great famine of 1877. In 1891 the weavers are returned as 365,112, and in 1901 as 383,132. So far as can be ascertained these numbers are comparable, and would show a slight increase in the actual number of weavers. The figures for 1911 are reported as 385,124, but this includes all mill hands and persons engaged in power factories connected with spinning and weaving. The number of these latter is 16,615, and deducting these, we obtain that the number of hand weavers in 1911, 368,509. I think, therefore, we may safely accept the following conclusion: That in the last forty years the number of hand-loom weavers has remained practically stationary, but that owing to stress of competition they now turn out a larger amount of finished goods than was formerly the case; that is to say, the majority of them have to work harder to make a bare living. One might also

add that their lot would probably be greatly improved if they could be induced to accept outside assistance, which can only be effectively rendered by the establishment of small hand-loom weaving factories. The individual weaver suffers because he is still trying to carry on a complex series of operations without recognition of the advantages of sub-division of labour.

93. *Coir*.—The cocoanut palm is grown all over the Presidency, but it is chiefly on the West Coast in the districts of Malabar and South Canara that the manufacture of coir is carried on. The extraction of the fibre is mainly the work of women, and during the past ten years the number engaged in this trade has largely increased. Groups 24 and 25 in the occupation tables include all the workers in this industry together with those engaged in the extraction of other fibres, of which, however, only palmyra fibre is of any importance. In 1901 the number of workers were 50,202 and in 1911, 63,046—an increase of 25 per cent. The internal trade in coir products is not very large and each district probably supplies its own requirements. The export trade is from the ports of Calicut and Cochin, where numerous presses have been set up for baling the yarn. Weaving, mat-making, and rope-making, are also carried on to some extent both by European and Indian firms. The following statements furnish statistical information regarding the progress and volume of the trade during the past ten years:—

Exports of coir and cordage for ten years.

94. *Dyeing*.—From the census returns this industry would appear to be in a decaying condition, as in 1901 it supported 10,061 people, and in 1911 only 7,208—a decrease of 28·3 per cent. The statistics of the trade, however, tell quite a different tale. In the following statement the value of the imports of alizarine and aniline dyes is given for the last ten years :—

Year.	Value. RS.
1901-02	11,47,479
1902-03	11,79,393
1903-04	13,56,255
1904-05	13,21,271
1905-06	13,60,300
1906-07	12,39,827
1907-08	16,64,534
1908-09	14,30,100
1909-10	15,75,533
1910-11	15,42,065

95. The average values during the last three years show an increase of 38 per cent. on the values of the first three years. This is very largely due to the expansion of the dye-houses attached to the Buckingham and Carnatic Mills in Madras, and to development of the turkey red industry in Madura. In the Madras mills the industry is run on modern lines and under the control of expert chemists. In Madura it may be regarded as an indigenous industry, modified for working with chemical dyes. The modern phase of the industry is due to Mr. L. K. Tulsiram, a Souráshtra of Madura, who was taught the methods of dyeing cotton yarn with alizarine dyes in the laboratories of the Badische Aniline Fabriker in Bombay. Tuticorin is the port through which the bulk of the dye-stuffs intended for Madura passes, and in 1901-02 the imports were valued at Rs. 1,51,519 and in 1910-11 at Rs. 5,26,795. A rough estimate places the outturn of the Madura dyed yarn at about 2,000 bales per month, equivalent to an annual output of nearly 10 million pounds. Dyeing is carried on in a small way in almost every place where there are weavers, but the industry is not in a flourishing condition, chiefly owing to the lack of technical knowledge on the part of the dyers.

96. *Indigo*.—In 1900-01 the area under indigo was over 250,000 acres, and the production of the dye was estimated to be 46,100 cwt., whilst by 1910-11 the area had dwindled down to 72,000 acres, with a yield of 12,600 cwt. It is hardly necessary to point out that this is due to the competition of artificially-produced indigo, and it seems not unlikely that the cultivation of the plant for the purpose of producing dye-stuffs will in time cease altogether. This has been the fate of madder. In recent years great efforts have been made to improve the methods of cultivation of the plant, and of extraction of the dye-stuff, and with a considerable measure of success; but militating against these improvements are corresponding developments in the manufacture of synthetic indigo, whilst finally the increased value of other agricultural products has in no small measure facilitated the transfer of indigo plantations to other forms of cultivation.

97. *Jute*.—The real jute (*Corchorus capsularis*) is not grown in this Presidency, but what is locally known as “jute” is the “Deccan hemp” (*Hibiscus cannabinus*), which is largely grown on red soils in the Northern Circars. There are two jute mills in the Presidency, one of which at Chitavalsa, near Bimlipatam, was established in 1867, and contains 3,328 spindles and 154 looms, and gives employment to 1,180 work people. The second mill was established at Ellore in 1907, and is equipped with 1,704 spindles and 80 looms and now employs 630 workers. The local market for gunnies is said to absorb the whole production of these two mills. There is a considerable export of raw jute, chiefly from the coast ports of the Northern Circars. From 1901 to 1906 it averaged Rs. 10·48 lakhs per annum and from 1906 to 1911 Rs. 14·06 lakhs per annum.

98. *Leather*.—The census returns are included in groups 32 and 33 of order 7. The number of persons engaged in the manufacture of leather has increased from 9,268 to 13,754, or by 48·3 per cent., but the number of persons engaged in the

manufacture of leather articles has decreased from 50,795 to 37,028, or by 27·1 per cent. As already explained this result is partly due to the rise in value of leather, which has led to its being replaced by iron as the material from which *kavalai* buckets are made. There is also some tendency to the concentration of this industry in factories, which is leading to the gradual extinction of the village *chuckler*, and a corresponding increase in the efficiency of production. Group 69 gives the number of boot, shoe and sandal makers, and these have increased from 111,585 to 123,253, or by 10·4 per cent. The leather trade in the Madras Presidency is of great importance as the following tabular statement in respect to the export trade will show:—

Year.	Raw hides and skins.		Tanned hides and skins.	
	CWT.	RS.	CWT.	RS.
1901-02	87,049	67,71,779	224,864	2,09,96,426
1902-03	76,135	52,08,957	218,846	2,33,89,128
1903-04	67,578	41,93,402	223,572	2,37,19,700
1904-05	97,924	71,80,409	215,702	2,30,27,813
1905-06	142,116	1,10,67,166	284,198	2,89,71,331

1907-08	85,081	73,91,568	224,908	3,07,79,225
1908-09	85,618	62,13,990	261,961	3,42,86,921
1909-10	76,970	74,93,746	257,970	3,24,67,993
1910-11	106,562	72,09,838	242,060	3,35,23,358

99. The exports of raw hides are insignificant, but since 1898 there has been a large demand, chiefly on the part of American tanners, for raw skins. This is partly due to fiscal regulations, whereby raw skins are admitted free of duty, whilst tanned and dressed skins are excluded by prohibitive import duties. The introduction of the chrome process is also partly responsible for the demand for raw skins. It should be clearly understood that the whole of export trade in the Madras Presidency is in tanned hides and skins, and not in finished goods. The hides are tanned, but not curried; and the skins are tanned, but not dressed. The returns from the Inspector of Factories show that, out of 18 tanneries in India employing over fifty hands, 14 are situated in the Madras Presidency, but all the Madras tanneries are small compared with those situated at Cawnpore and at Siou near Bombay. No information is available as to the number of tanneries in the Presidency, and the state of the trade may be best gauged by the increased value of the exports. Hide tanneries are generally much smaller than those devoted to skins. The capital outlay involved in setting up a tannery, even of the largest kind, is not much and there are numerous small tanneries in which a few hundred rupees will probably cover the whole cost. As a natural consequence work is carried on in the tanneries very irregularly, all the more so as the tanners themselves have generally very little capital, and are almost entirely dependent upon advances from the export merchants wherewith to buy skins or hides to carry on their business. Tanning is carried on in the Madras Presidency in a very primitive way, and the first step towards improving matters was taken by the Madras Government when they sanctioned in 1903 the experiments in chrome tanning, which eventually led to the establishment of the Government Chrome Tannery at Sembiam. A considerable measure of success attended these pioneer operations, and eventually in 1910, two large private chrome tanneries having been established in the south of India, the Government factory was sold. The locally made chrome leather is mainly used for boots, shoes and sandals, and for water buckets, and *kavalai* trunks; but the demand in the latter direction has not expanded so rapidly as it might have done owing to the introduction of iron water buckets.

100. *Manures*.—The demand for artificial manures in this Presidency has hitherto been mainly confined to planters, but the ryot is now, in a small way, beginning to appreciate the advantage of using suitable fertilizers, and the industry, though still a small one, shows signs of expansion. At the same time the following table shows that the foreign export trade is growing, and that the Presidency is parting

with large quantities of valuable manure, which could, with very much greater profit, be employed in increasing the productivity of the soil :—

Ten firms are altogether reported to be engaged in the manufacture of artificial manures, and on the West Coast the preparation of fish manures is an industry of considerable importance.

102. *Metal workers.*—Under this head may be included all the artizans working in the non-ferrous metals, excluding gold and silver. Their numbers have increased from 19,578 to 20,857. The raw material with which these men work is mainly imported from abroad, and it is impossible to reconcile the small increase in the number of men employed in the trade with the very large increase in the imports shown in the following tabular statement: an examination of which discloses the fact that, whilst the imports of copper and yellow metal for the three years from 1900 to 1903 amounted to 74,444 cwt., in the three years ending March 1911 they amounted to 205,280 cwt. Similary the imports of tin have increased from 4,691 cwt. to 10,226 cwt. The expansion of the aluminium industry has already been noted. The increased consumption of these metals is a very certain indication of a widely diffused increase in the wealth of the people, as among the poorer classes the substitution of metal vessels for earthenware is an infallible sign of prosperity :—

103. *Iron trade.*—The number of large engineering works in the Presidency is small. The locomotive and carriage building works of the Madras and Southern Mahratta Railway at Perambore and those of the South Indian Railway at Negapatam, besides smaller repair shops and running sheds at the more important junctions, represent the only big developments in this direction. The Public Works Department has engineering shops in Madras, Bezwāda, and Dowlaishwaram; and there are five or six private firms, mostly under European management, which supply all the local engineering requirements. Repair work, and the manufacture of structural iron work, cover the bulk of the business done in this Presidency, but recently certain classes of machinery largely used in this country have been manufactured locally. No useful statistics regarding the state of the industry can be furnished, as the sea-borne trade returns on private account are altogether swamped by the inclusion with them of the railway imports. All that can be said is that during the last decade there has developed throughout the country a distinct tendency to substitute machinery for hand labour, wherever the work can be sufficiently concentrated to render it possible to find adequate employment to keep the machinery continuously at work.

104. *Sugar.*—In this Presidency sugar is obtained both from sugarcane and from palmyras. The area under sugarcane in 1910–11 is reported to have been 94,879 acres and the area under palmyras 88,740. The changes in the classification of the census returns prevent any comparison with the figures of the 1901 census. Group 62 shows that there are 18,212 people engaged in the manufacture of sugar, molasses and gur. Of modern sugar factories there are only five in the Presidency, three of which are under the management of Messrs. Parry & Co., the most important being at Nellikuppam in the South Arcot district, with an average outturn of 12,000 tons of sugar per annum. In addition to the local supplies of sugarcane from the surrounding villages, large quantities of jaggery are imported from Java, and converted into refined sugar, whilst, as by-products, spirits and carbonic acid gas are largely manufactured, the average outturn of spirits being 705,217 gallons of London Proof spirits per annum. Recently great efforts have been made to encourage the local cultivation of the cane, and from an average of about 600 acres per annum it has increased this year to considerably over 2,000 acres. In very few parts of the country is the cultivation of sugarcane sufficiently concentrated to justify the establishment of large factories for crushing the cane and converting it into finished products. There are but few individuals who cultivate a large extent of cane, and, in the absence of any co-operative movement among the cane growers, all operations connected with the industry are of a very primitive type, and there is not only a large waste of raw material, but the expenses connected with its manufacture into jaggery are unnecessarily high. As it is probable that the attention now being paid to the sugar industry will lead to considerable developments in the not distant future, the following tabular statement has been prepared showing the area under both sugarcane and palmyras in each district for the year 1910–11:—

Acreeage in 1910–11.

105. *Silk*.—Sericulture is only carried on in the Kollegal taluk of the Coimbatore district, where the area under mulberries fluctuates from year to year for reasons which I have not been able to ascertain. This is clearly shown by the following figures for the last ten years :—

									Acs.

106. No information is available regarding the value of the outturn of silk, but it is insufficient for the needs of the Presidency, and there are large rail-borne imports from Mysore, of which only about 10 per cent. are exported *viâ* Madras, the remainder being used by the silk weavers of the Presidency. The following tabular statement gives the values of imports of raw silk and piece-goods during the last ten years :—

Year.	Raw silk.			Piece-goods.		
	Foreign.	Indian.	Total.	Foreign.	Indian.	Total.
	RS.	RS.	RS.	RS.	RS.	RS.
1901-02	1,365	34,72,339	34,73,704	2,637	1,98,537	2,01,174

1905-06	8,673	39,37,343	39,46,016	...	75,572	75,572
1906-07	5,704	37,03,295	37,08,999	1,088	12,145	13,233
1907-08	6,384	48,18,815	48,25,199	4,737	15,583	20,320
1908-09	29,526	36,93,677	37,23,203	9,900	27,732	37,632
1909-10	68,235	32,98,533	33,66,768	11,711	2,74,482	2,86,193
1910-11	62,233	22,31,440	92,93,673	7,919	2,417	10,336

107. Apart from the transit trade through Madras, the exports are of insignificant value. From the occupation tables it appears that under group 27 the number of silk spinners and weavers has increased from 30,423 to 36,854, or by 21·1 per cent. It must not however be imagined that any very large percentage of these weavers are engaged in the manufacture of pure silk fabrics, as the majority of them only use silk for the borders of the cloths which they manufacture, or, in the case of women's cloths, unions are made consisting of cotton warps with silk wefts. There is, however, a certain amount of silk brocade manufactured, heavily decorated with gold lace. These cloths probably represent the highest development of the weavers' art in Southern India, and are chiefly made in the Tanjore district.

108. *Wood*.—Workers in wood, such as sawyers, carpenters, turners, cabinet-makers, etc., form an important section of the artizan population, and are enumerated in groups 36 and 74. Sawyers, carpenters, and joiners have increased from 131,244 to 146,583, or by 11·6 per cent., whilst cabinet-makers and carriage builders have increased from 805 to 1,885. This is a trade in which female labour is never employed, and the inclusion of 7,515 women must be regarded as a mistake due either to a number of dependents having been enumerated as actual workers, or to the inclusion of coolies working in connection with house-building and so forth.

The principal sources of supply of timber are the forests of the Presidency, and imports from Burma, which consist almost entirely of teak. Compared with most countries of the world, in India timber is very expensive, owing not so much to the shortage of supply, as to the inferior quality of the wood yielded by the timber trees in the forests. Teak is unquestionably for general construction work the best wood grown, but the local supply is very small, and most of it is imported from Burma. The chief defects of Indian timbers are their great weight, extreme hardness and rough fibrous structure. The largest saw mills in the Presidency were situated at Calicut, but they have recently gone into liquidation, and in various parts of the country, where large supplies of timber are dealt with, either of local growth or imported, small saw mills, worked by steam or oil-engines or, in the case of Madras, by electro-motors, have been established. There is probably room for development in this direction, as cutting up timber by hand is not only expensive, but involves a considerable waste, owing to the unnecessary amount of saw-dust produced through irregular sawing. Under European supervision, and in some few instances without it, the wood workers are capable of turning out excellent work, examples of which may be found chiefly among carriage builders and cabinet-makers. The wood carvers of the Presidency enjoy a high reputation, but, owing to their inability to adapt their art to modern requirements, the demand for their work is very much smaller than it otherwise might be.

109. *Vegetable oils.*—The cultivation of crops yielding oil as the principal product is carried on very extensively in most districts of the Presidency. Appendix VI furnishes information as to the area under each crop in each district of the Presidency. Of the produce a large amount is consumed locally, but the export trade to other parts of India and to other countries is very large and has been growing rapidly in recent years. Group 53 of the census returns relates to people engaged in the manufacture of vegetable and mineral oils. The numbers have decreased from 27,170 in 1901 to 25,095 in 1911. This, in face of a large increase in the export trade in oil, indicates either a decrease in the local demand, or the introduction of improved methods of extracting oil. It is probable that both causes have been at work to some extent, as the rapidly extending use of mineral oils for lighting purposes has of necessity caused a decrease in the demand for vegetable oils. The following table shows the average weight and value of the exports of oil-seeds during the last ten years, also the number of gallons and value of the vegetable oils similarly exported :—

	Oils.		Oil-seed.	
	Quantity.	Value.	Quantity.	Value.
	GALLS.	RS.	CWT.	RS.
Gingelly	360,525	5,42,189	340,257	25,73,457
Groundnut	2,159,444	30,36,554	1,755,123	1,27,58,776
Castor	648,231	6,98,633	354,777	22,58,205
Cocoonut	6,460,179	91,77,651	369,561	52,07,622
Other sorts	78,158	96,379		
Cotton			144,372	4,26,460

110. The following are the reasons which may be assigned for the fact that oil-seeds are exported and not the oils :—

(1) Oil-seeds can be packed in bags or carried in bulk, whereas oil must of necessity be carried in expensive casks.

(2) There is a much better market for oil-cake in Europe than in India, and the freight on oil-seeds is less than the freight on oil-cake.

(3) Protective tariffs encourage the importation of seed to the exclusion of oil, thereby securing to the importing country the business of extracting the oil.

A return furnished by the Board of Revenue shows that in 1899-1900 the District officers reported the existence of 16,018 oil mills, a much larger number than one would expect from the census returns, which, however, in all probability do not accurately reflect the existing condition of things. Oil-milling in rural parts is not often a separate business, and many of the ryots have oil mills which they run occasionally when cattle labour is available to work them. The old wooden mill is to be found in every part of the country, but, for the extraction of castor-oil, large iron screw presses worked by a number of coolies are employed, and there is a growing tendency to put down small groups of iron *ghani* mills worked by an oil-engine. On the West Coast, in connection with the extraction of cocoanut oil from copra, there has been a very large development of this trade, though most of the mills are situated in the Cochin State. Steam power is employed to drive them, and a typical plant consists of from 30 to 50 *ghanis*, or rotary mills, each extracting the oil from about 45 lb. of copra per hour.

111. *Mineral oils*.—Although no mineral oils are raised in the Presidency, and they are not themselves the raw material for other industries, the trade in them has become of very great importance, and its development to some extent is an index of the progress that is being made in the country. In appendix VIII, the import trade both by rail and by sea is summarized for the past ten years. Under each head it will be seen that there have been great developments. The expansion in the use of lubricating oils indicates developments of the use of machinery, and the introduction of fuel oils is coincident with the development of irrigation by pumping. Whilst the bulk oil trade has not appreciably increased in value, there have been large developments in the use of case oil. The trade is entirely in the hands of three large companies, and the arrangements for the delivery and storage of oil in every large centre of population in the country are very complete.

112. The census returns, supplemented by the vast amount of statistical information which is collected by the various departments of Government which deal with agriculture, industries, and commerce, throw a good deal of light upon the economic conditions of the people, and, whilst revealing in unmistakable terms the poverty of the country measured by a European standard, equally clearly show that there is a steady advance in almost every direction. When one takes into account the extraordinarily favourable conditions under which a mere animal existence can be carried on, due to the mildness of the climate, and the comparatively little labour required to procure all the necessities of life, it becomes obvious that no comparison based on statistical data places the position of the people of the Madras Presidency in a proper light. Excluding seasons of scarcity and famine, the bulk of the people are on the whole as well off as the peasantry in most countries of Europe, and nowhere does the misery and destitution exist which is to be found in almost every large town in Europe. It is true that the people here are even poorer, but their poverty entails but little hardship.

113. The census returns emphasize the fact that the Presidency is essentially an agricultural country, with only 5 per cent. of its population actually engaged in industrial work. Comparison with the figures of the previous censuses is not possible as the methods of classification have changed so often, but it may be surmised that the percentage of people engaged in industries is decreasing, or at the best stationary. It is well known that there has been no large industrial development of any kind, which would give occupation to a large number of people, whilst there has been a by no means insignificant development in the use of machinery, which has thrown out of employment much industrial labour of a low type. For instance hand-spinning is practically extinct, rice pounding is beginning to disappear, and in a number of other occupations small factories employing machinery are displacing hand labour. The change, however, is going on gradually, and the people have time to adjust themselves to the changed conditions, so that, if the cry regarding the scarcity of labour can be accepted as genuine, there is at any rate no lack of employment. It is doubtful, however, if there is any real scarcity of labour, as the cry comes mainly from those who refuse to recognize that a permanent rise in

the price of food-grains by not less than 50 per cent. necessitates at least a corresponding rise in the wages of the labouring classes. The emigration statistics show that during the last ten years more than three and a half millions of people have left the country, and that three millions have returned from foreign plantations, resulting in a net loss, on this account, of over half a million people. The loss, however, in the labour market is greater than this, as a large percentage of those who return have materially improved their position, and have not come back again to work as coolies in the fields. Even assuming however that emigration provides an outlet for 100,000 able bodied people per annum, this is slightly less than one-third of the natural increase in the population. So far the labour thrown on the market by the increased use of machinery probably does not amount to 10 per cent. of this, and it will certainly be a very long time before the outlets for emigration are insufficient to prevent over-crowding in the south of India.

114. During the ten years under review it may be fairly said that the people of India have become alive to the necessity for the creation of some measure of industrial life. Experiments, rash and ill-considered in most cases, have been made in all parts of the country, but the many failures have produced a smaller measure of discouragement than might have been anticipated. In the Madras Presidency progress has chiefly been in the direction of the establishment of small factories; and the majority of these have proved successful, mainly because the economies possible by the introduction of mechanical methods of working have more than counterbalanced the losses due to want of skill and experience. So far, however, the attempts to organize the hand-loom trade in small factories have met with but little success. Many factories have closed down, and the few that remain are struggling with the difficulties chiefly created by the hand weaver. There are approximately half a million people engaged in this industry, but their outturn averages not more than 112 lb. of cloth per head per annum. If the weavers were amenable to discipline, and willing to work eight hours a day in a factory, and if proper organization and sufficient capital were supplied, either one-third of the people now engaged in this trade would suffice for the present production, or a vast increase in the outturn of finished goods would be possible. It is not suggested that the most elaborate organization in the world will enable the hand-loom weaver to compete with the power loom in the manufacture of what may be termed typical power loom goods, but the hand weaver can turn out something which is altogether different from the output of the power loom, and it possesses certain advantages which enable it to command a higher price. If the difference in price between the two classes of goods be not too great, the hand-loom products will be in much larger demand, and there can be no doubt that the future of the hand-loom industry depends almost entirely upon the improvement of the hand-loom weaver himself.

115. The conditions in Madras are probably less favourable than in any other part of India for the creation of an industrial system on modern lines. Not only are its natural resources limited to agricultural products, but there is no concentration either of industry or population in local centres which would create favourable conditions for the disposal of local manufactures. For nearly every class of goods the market is widely diffused, and extremely vulnerable to imports owing to the extensive sea coast with numerous ports of entry. The Government may not unfairly claim that much of the progress between 1901 and 1911 is due to their efforts to give suitable assistance to private enterprise; they have accepted the policy that industries must exist before technical education can be of any use, and that the Education Department can only provide for existing wants and cannot create new openings. Whilst the work actually done under Government supervision was by no means inconsiderable since it resulted in the successful establishment of the Aluminium industry, of the chrome leather industry, of irrigation by pumping, of the rural industrial factory, and in the substitution of the fly-shuttle loom for the indigenous hand-loom over large areas, it may claim even indirect results of greater importance, as the operations of the Department of Industries have undoubtedly stimulated private enterprise in every part of the Presidency. This conclusion is

substantiated by the facts enumerated in this review of industrial progress during the past ten years, and may be best summarized by the progress made in the use of small prime-movers, whether they be worked by gas, oil or steam.

116. The swadeshi movement led to the establishment of not a few experimental enterprises which have unfortunately met with comparatively little success. Attempts have been made to establish factories for the manufacture of pencils, soap, candles, pens, matches and glass; but, for one reason or other, none of them have proved profitable, and the only developments due entirely to private initiative are the rice factories in the Gódávári and Kistna deltas, and the revival and expansion of the Madura dyeing industry.

117. The preparation of this chapter has necessitated examining the statistical information published by Government, and whilst it shows that there is a large amount of material available for the review from time to time of industrial progress, it also reveals the fact that in certain important directions the information available is inaccurate because it is incomplete. The unrest and discontent with the existing régime, which has marked the opening years of the twentieth century in India, is largely due to economic causes, and to ignorance of real facts. On the one side, too much attention is probably concentrated on the rapid expansion of the foreign trade of the country, whilst on the other, too narrow a view is taken of the land revenue administration and the effects of periodic revision of the land settlements. A wider and more detailed knowledge of the economic condition of the country on the part of the educated public is called for, and it seems possible that it would be advantageous to introduce legislation to enable this result to be obtained with greater accuracy than is at present possible.

118. Attention may be drawn to an English Act to provide for taking a census of production which was passed by Parliament in 1906. This Act empowers the Board of Trade to take a census of production in the year 1908, and subsequently in such years as may be determined by an order of the Board of Trade. It empowers the Board of Trade to call for returns from every factory or workshop under the Factory and Workshop Act of 1901; from every mine or quarry; from every builder; from every person who by way of trade or business executes works of construction, alteration, or repair; from every person who by way of trade or business gives out work to be done elsewhere than on his own premises; and from every person carrying on any other trade or business which may be prescribed. It provides that the returns so received shall be treated as confidential, and that the data derived from them shall be published in such a way as shall not disclose information which shall be detrimental to the individuals or companies furnishing the same. Finally, it authorizes the imposition of penalties for infraction of the clauses enumerated.

119. The enforcement of such an Act in India would be impracticable whilst the scale of production remains so extremely small. Moreover, the statistics of the sea borne trade, and the returns furnished by the cotton industry, supply a large amount of information from which very definite deductions may be drawn regarding a very large part of the industrial work going on in the country. From the register of licensed steam-boilers it should be possible to trace the gradual extension in the use of steam power, but at the present time there is no means of ascertaining the number, or power of the steam-engines actually employed; or, what is of even greater importance, the number or horse-power of the various forms of internal combustion engine, the use of which is so rapidly extending. It would, I think, be desirable that every prime-mover in the country should be registered. Information appears to be collected from time to time in the Revenue Department regarding such items as the number of hand-looms, the number of oil-mills, the number of wells used for irrigation and so forth; but there appears to be some doubt as to whether the returns furnished are sufficiently accurate, and it might possibly be useful to take power to carry out at convenient intervals a census of such items of production, chiefly in the way of tools and plant, which would furnish reliable data on which to base generalizations regarding economic questions. The tendency

is towards the introduction of power on a small scale in rural tracts, and we may look forward to a time when in almost every village these small prime-movers will be found doing work which is now performed by cattle power. Owing to the fact that nearly all the machinery used in this country is imported from abroad, much useful information could be obtained by a more detailed classification of the goods passing through the custom-house, especially under the heading "Machinery and Mill work." It would not be difficult to record separately details regarding such machinery as engines, whether steam, gas or oil, dynamos and electro-motors, pumps, rice-hullers, sugar-mills, and so forth. The monthly statement of imports and exports simply gives the number of cases arriving from foreign countries, and their value; whilst the sea borne trade returns attempts some classification, but of such a vague nature as to be of little practical use. The terms "unenumerated," "other sorts," "other descriptions" generally cover by far the largest items so far as value is concerned, and it is more detailed information on these points which is so urgently needed to enable the industrial changes going on in the country to be placed in their proper perspective. An examination of the trade returns of the last ten years reveals the fact that the imports of the five years ending 1910-11 compared with those of the five years ending 1905-06 show increases as follows:—

	LAKHS.									
Machinery	...	...	...	...	...	...	...	...	...	71
Scientific apparatus	...	...	...	...	...	...	...	...	...	28
Chemicals	...	...	...	...	...	...	...	...	...	18

This is no doubt useful information as indicating a general tendency towards a higher state of industrialism, but its value would be greatly enhanced if the direction in which increasing use was being made of such imports was also indicated.

APPENDICES.

APPENDIX I.

Occupation.

Description of occupation.	Workers, 1901.			Workers, 1911.			Percentage of increase or decrease.
	Males.	Females.	Total.	Males.	Females.	Total.	
1	2	3	4	5	6	7	8
Order V.—Salt, etc.	...	...	...	768	282	1,050	...
19. Rock, Sea and marsh salt	...	...	...	483	78	561	...
20. Extraction of saltpetre, alum and other substances soluble in water.	1,296	1,125	2,421	285	204	489	— 79·6
Order VI.—Textiles	...	...	...	455,181	290,872	746,053	...
21. Cotton ginning, cleaning, etc.	12,643	11,446	24,089	20,067	12,486	32,553	+ 35·1
22 & 31. Cotton spinning, sizing, and weaving.	398,426	225,357	623,783	{ 385,124 1,203	{ 193,584 410	580,321	— 6·9
23. Jute spinning, pressing, etc.	455	78	533	1,925	503	2,428	+ 355·5
24. Rope, twine and string	5,367	37,009	42,376	7,082	46,712	53,794	+ 26·9
25. Other fibres (cocoanut, aloes, flax, hemp, etc.).	3,672	4,214	7,886	1,476	7,776	9,252	+ 17·3
26. Wool carders and spinners, etc.	...	...	...	11,561	11,445	23,006	...
27. Silk spinners and weavers	14,219	16,204	30,423	21,402	15,452	36,854	+ 21·1
28. Hair, camel and horse hair, etc.	...	...	...	634	3	637	...
30. Dyeing, bleaching, printing preparation and sponging of textiles.	6,564	3,497	10,061	4,707	2,501	7,208	— 28·3
Order VII.—Hides and skins, etc.	...	...	...	46,532	4,414	50,946	...
32. Tanners, curriers, leather dressers, etc.	8,138	1,130	9,268	12,872	882	13,754	+ 48·3
33. Makers of leather articles	45,262	5,533	50,795	33,551	3,477	37,028	— 27·1
34. Furriers	...	...	...	9	29	38	...
35. Bow, ivory horn, shell, etc., workers	112	2	114	100	26	126	+ 10·5
Order VIII.—Wood	...	...	...	198,036	82,480	280,516	...
36. Sawyers, carpenters, turners, etc.	127,136	4,108	131,244	139,068	7,515	146,583	+ 11·6
37. Basket makers and other industries of woody material.	61,354	81,480	142,834	58,968	74,965	133,933	— 6·2
Order IX.—Metals	...	...	...	73,967	7,102	81,069	...
38. Forging and rolling of iron and other metals.	266	...	266	845	3	848	+ 218·8
39. Plough and agricultural implement makers.	951	39	990	551	137	688	+ 30·5
40. Makers of arms, gun, etc.	1,080	22	1,102	212	5	217	— 80·3
41. Other workers in iron and makers of implements and tools.	51,840	3,972	55,812	52,882	5,555	58,437	+ 4·5
42. Workers in brass, copper and bell-metal.	14,248	826	15,074	14,672	1,095	15,767	+ 4·6
43. Workers in other metals (tin, zinc, lead, etc.).	4,237	264	4,404	4,783	307	5,090	+ 13·6
44. Workers in mints, die-sinkers, etc.	190	...	190	42	...	42	— 77·9
Order X.—Ceramics	...	...	...	85,147	47,799	132,946	...
45. Makers of glass and crystal ware	} 931	486	1,417	{ 482	124	606	} — 50·5
46. Makers of porcelain and crockery				{ 88	7	95	
47. Potters and earthen pipe and bowl makers.				75,301	44,239	119,540	
48. Brick and tile makers	6,397	2,940	9,337	8,432	2,797	11,229	+ 20·2
49. Others (mosaic, tale mica, alabaster, etc.).	17	5	22	844	632	1,476	+ 6,609·1
Order XI.—Chemical products, etc.	...	...	...	20,614	8,189	28,803	...
50. Manufacture of matches and explosive materials.	1,304	148	1,452	287	183	470	— 67·6
51. Manufacture of aerated and mineral waters.	123	3	126	527	15	542	+ 330·1

APPENDIX I—*cont.**Occupation—conold.*

Description of occupation.	Workers, 1901.			Workers, 1911.			Percent- age of increase or decrease.
	Males.	Females.	Total	Males.	Females.	Total.	
1	2	3	4	5	6	7	8
Order XI.—Chemical products, etc.—<i>cont.</i>							
52. Manufacture of dyes, paint, ink, etc. ...	...	...	...	1,127	462	1,589	...
53. Manufacture and refining of vegetable and mineral oils.	20,202	6,968	27,170	17,884	7,211	25,095	- 7.6
54. Manufacture of paper, card-board, etc.	...	...	...	118	6	124	...
55. Others (soap, candles, etc.) ...	...	...	...	671	312	983	...
Order XII.—Food industries ...	...	...	...	37,186	134,221	171,407	...
56. Rice pounders, huskers, and flour grinders.	15,866	152,090	167,956	17,959	107,715	125,674	- 25.1
57. Bakers and biscuit makers ...	1,986	318	2,304	2,947	3,068	6,015	+ 161.0
60. Fish curers ...	...	...	...	1,196	1,340	2,536	...
61. Butter, cheese and ghee makers ...	...	...	...	136	87	223	...
62. Makers of sugar, molasses and gur ...	...	...	...	3,873	14,339	18,212	...
63. Sweetmeat makers, preparers of jam, etc.	...	...	...	5,437	4,855	10,292	...
64. Brewers and distillers ...	249	40	289	791	2,155	2,946	+ 919.3
66. Manufacturers of tobacco, opium and ganja.	6,183	469	6,652	4,847	662	5,509	- 17.1
Order XIII.—Industries of dress and toilet.	...	...	...	134,185	30,457	164,642	...
67. Hat, cap and torban makers ...	329	1,084	1,413	250	1,517	1,767	+ 25.0
68. Tailors, milliners and dress makers ...	20,888	10,727	31,615	25,549	12,001	37,550	+ 18.7
69. Shoe, boot and sandal makers ...	99,967	11,618	111,585	107,382	15,871	123,253	+ 10.4
70. Other industries pertaining to dress, gloves, socks, etc.	75	36	111	1,004	1,068	2,072	+ 1,766.6
Order XIV.—Furniture industries ...	...	...	...	1,654	241	1,895	...
74. Cabinet makers, carriage painters, upholsterers, etc.	762	43	805	1,644	241	1,885	+ 134.1
75. Upholsterers, tent makers, etc. ...	...	...	...	10	...	111	...
Order XV.—Building Industries ...	...	...	...	199,883	83,988	283,871	...
76. Lime burners, cement workers ...	2,674	3,240	5,914	3,567	3,076	6,643	+ 12.3
77. Excavators and well sinkers ...	99,816	81,311	181,127	75,496	54,585	130,081	- 28.1
78. Stone and marble workers ...	95,396	22,284	117,680	107,950	19,841	127,791	+ 8.6
79. Others (thatchers, tilers, plumbers, lock-smiths, etc.	3,049	154	3,203	12,870	6,486	19,356	+ 504.3
Order XVI.—Construction of means of transport.	...	...	...	1,561	13	1,574	...
80. Cart, carriages, palki, etc., makers and wheel wrights.	...	...	...	512	11	523	...
81. Saddlers, harness makers, whip and lash makers.	107	38	145	159	1	160	+ 10.3
82. Ship and boat builders ...	356	8	364	890	1	891	+ 144.8
Order XVII.—Production and transformation of physical forces.	...	...	...	...	...	...	...
83. Gas workers, electric light and ice factories.	47	8	55	419	13	432	+ 685.4
Order XVIII.—Industries of luxury and those pertaining to literature and the arts and the sciences.	...	...	...	121,916	8,568	130,484	...
84. Printers, lithographers and engravers ...	4,752	12	4,764	6,912	70	6,982	+ 46.5
86. Book-binders and stitchers ...	1,200	...	1,200	1,818	35	1,853	+ 54.4
87. Makers of musical instruments ...	117	6	123	233	10	243	+ 97.5
88. Makers of watches and clocks, etc. ...	472	...	472	610	9	619	+ 31.1
89. Workers in precious stones and metals, etc.	96,261	3,730	99,991	108,680	6,886	115,566	+ 15.6
90. Makers of bangles, rosaries, bead and other necklaces, etc.	...	...	...	3,360	1,494	4,854	...
91. Toy kite, oage, fishing cattle, etc. ...	497	141	638	303	64	367	- 42.4
